RE: DRAFT **CORRECTIVE ACTION REPORT FOR GROUNDWATER**
MARYLAND SQUARE SHOPPING CENTER
3661 SOUTH MARYLAND PARKWAY
LAS VEGAS, NEVADA
FACILITY ID NO. H-000086

Dear Mr. Russell:

Enclosed please find one copy of the Draft Corrective Action Report for Groundwater for the above referenced project as requested by the Nevada Division of Environmental Protection Bureau of Corrective Actions (BCA). This report is being provided to BCA in electronic Adobe Acrobat format on this date, June 14, 2013. Hard copies of the report will be forthcoming.

Should you have questions or require additional information, please do not hesitate to contact Robert Manriquez, Program Manager, at 619.321.6748, or myself at 619.525.7188. Thank you for your time and consideration in this matter.

Regards,

Steven N. Bradley, CEG, CEM
Certified Environmental Manager
CEM No. 1333, Exp. March 22, 2015

CORRECTIVE ACTION REPORT

The Maryland Square Tetrachlorethene (PCE) Site (Site) is within an area of Las Vegas, Nevada, approximately 2 miles east of downtown Las Vegas. The Site contains a 6,000-foot-long plume of dissolved-phase PCE in the shallow groundwater (Figure 1). PCE-contaminated soil at the source area has been cleaned up, but not the PCE plume in groundwater. This Corrective Action Report (CAR) for Groundwater provides the results of the bench- and pilot-scale studies and additional characterization conducted to guide the selection and design of a remedy for the PCE-contaminated groundwater.

1.0 BACKGROUND

The area of Las Vegas that includes the former Maryland Square Shopping Center (the Property) was developed mainly in the 1960s and 1970s. This shopping center formerly housed a dry cleaning facility, which operated from 1969 to 2000. Historical discharge of PCE at this former dry cleaner was discovered during an environmental site assessment (ESA), and was reported in 2000 to the Nevada Division of Environmental Protection (NDEP) spill reporting hotline (NDEP 2012b). This section provides detailed information on site location and history, as well as a summary of the *Corrective Action Plan for Groundwater* (GW CAP) (Tetra Tech EM Inc. [Tetra Tech] 2011a).

1.1 Site Description

The former dry cleaners (Al Phillips the Cleaner) operated for more than 30 years at the Property, at 3661 S. Maryland Parkway. The former dry cleaner was on the west side of South Maryland Parkway, across the street from the Boulevard Mall (Figures 1 and 2). The exact date of the release (or releases) from the dry cleaners is unknown, although one 100-gallon spill was documented to have occurred in 1982.

Historical discharge of PCE at the former dry cleaners facility was discovered during a due diligence ESA (NDEP 2012b), and was reported on November 29, 2000, via the NDEP spill reporting hotline. In June 2005, the former shopping center, including the dry cleaners, was demolished.

A series of environmental investigations occurred on and off the Property from 2000 to present. Investigations on the Property determined the extent of PCE-contaminated soil. Investigations on and off the Property determined the extent of PCE-contaminated groundwater. Additional information on the history of the Site, as well as a list of previous investigations, appears in the GW CAP (Tetra Tech 2011a). In addition, the administrative record for the Site is available on-line at NDEP's website: http://ndep.nv.gov/pce/foia.htm. PCE-contaminated soil was removed from the Property in the summer of 2011.

The PCE plume in shallow groundwater extends downgradient of the former dry cleaners, beneath the Boulevard Mall, residential properties, a golf course, and past Eastern Avenue, which is approximately 6,000 feet (ft) downgradient (Figure 3)..

1.2 Corrective Action Plan

The GW CAP (Tetra Tech 2011a) developed and evaluated potential remedies for cleaning up shallow groundwater contaminated with PCE. The primary purpose of the GW CAP was to establish a process, schedule, and criteria to evaluate and select a corrective action for cleanup of shallow groundwater. Secondary purposes were to identify data gaps and propose actions needed to complete selection of a corrective action and facilitate design.

Preliminary corrective action objectives (CAO) and preliminary remediation standards were developed to evaluate corrective actions. As stated in the GW CAP, these preliminary CAOs and remediation standards would be refined and finalized after completion of the Screening Level Human Health Risk Assessment (SLHHRA). The preliminary methodology for the SLHHRA was summarized in the Indoor Air and Well Water (IA/WW) Work Plan (Tetra Tech 2011b), approved by NDEP on August 23, 2011. Preliminary CAOs defined in the GW CAP were:

1. Protect human health by reducing inhalation exposure to PCE and daughter products emanating from groundwater containing PCE concentrations above the remediation standard.

2. Remediate shallow groundwater where PCE concentrations exceed the remediation standard for groundwater.

In addition, the following objective was identified in the IA/WW Work Plan:

3. Take appropriate action to assure that the drinking water standards for PCE and its degradation products are not exceeded in domestic wells identified within the 5 micrograms per liter (µg/L) boundary of the plume.

The preliminary numerical remediation standard for PCE in shallow groundwater was 5.0 µg/L, the maximum contaminant level (MCL) promulgated under the Safe Drinking Water Act. The preliminary numerical remediation standard for PCE in indoor air is the concentration associated with a 10^{-6} carcinogenic risk as published in the United States Environmental Protection Agency's (EPA) Region IX Regional Screening Levels (RSL) for indoor air in a residential scenario. When the GW CAP was written, this concentration was 0.41 micrograms per cubic meter (µg/m^3), but has since changed to 9.4 µg/m^3. The concentration equivalent to a hazard index (HI) describing noncarcinogenic risk also changed from 276 to 42 micrograms per cubic meter (µg/m^3) (EPA 2012).

The GW CAP identified general response actions (GRA) using the preliminary CAOs and numerical remediation standards, and technologies under these GRAs were evaluated for implementability, effectiveness, and cost. Technologies found viable were subsequently assembled into Corrective Action Alternatives. These alternatives were then analyzed using the following eight National Oil and Hazardous Substances Pollution Contingency Plan (NCP) feasibility study evaluation criteria listed under 40 *Code of Federal Regulations* (CFR) 300.430 (e) (9): (1) overall protection of human health and the environment; (2) long-term effectiveness and permanence; (3) reduction in toxicity, mobility, and volume through treatment; (4) short-term effectiveness; (5) implementability; (6) cost; (7) state acceptance; and (8) community acceptance. The alternatives analyzed included:

- Alternative 1 – No Action
- Alternative 2A – In Situ Chemical Oxidation (ISCO) of Target Areas, Institutional Controls (IC), Subslab Depressurization (SSD) Systems, and Long-Term Monitoring (LTM)
- Alternative 2B – ISCO of the Entire Plume, ICs, SSD Systems, and LTM
- Alternative 3 – Permeable Reactive Barrier (PRB) Upgradient of the Residential Area, ICs, SSD Systems, and LTM
- Alternative 4 – Sparge Curtain Upgradient of the Residential Area, ICs, SSD Systems, and LTM
- Alternative 5 – Groundwater Extraction and Treatment, ICs, SSD Systems, and LTM
- Alternative 6 – In Situ Enhanced Bioremediation of Target Areas, ICs, SSD Systems, and LTM.

Alternative selection was deferred pending proof of performance of some of the proposed technologies; ISCO and air sparging were selected for pilot-scale testing (Appendix C of the GW CAP) as detailed in the next section. Pumping tests were to be conducted to better evaluate the feasibility of groundwater extraction and treatment as a corrective action. The GW CAP acknowledged that corrective action might require a multi-faceted approach because of the magnitude and extent of PCE contamination and aquifer heterogeneities. NDEP approved the GW CAP on September 8, 2011.

1.3 Proposed Aquifer Testing and Pilot Testing

Based on a review of the existing data, the GW CAP (Tetra Tech 2011a) concluded that additional data were needed for selection and design of the corrective action. Appendix C of the CAP, *A Work Plan for Bench and Pilot Tests*, outlined the proposed activities that included:

- Aquifer tests using constant rate pumping tests and step-drawdown pumping west of the Boulevard Mall, near MW-14, and in the parking lot east of Boulevard Mall.
- Vertical delineation to evaluate contaminant migration through the subsurface west of the Boulevard Mall, near MW-14, and in the parking lot east of Boulevard Mall.
- Bench-scale testing to measure natural oxidant demand (NOD) of soil at the Site.
- Pilot testing of air sparging (AS) with soil vapor extraction (SVE), ISCO using permanganate or persulfate, and ISCO using ozone and hydrogen peroxide.

1.4 Addenda and Deviations

Several addenda were prepared after submittal of the GW CAP as summarized in Table 1-1 below.

TABLE 1-1: Addenda and Deviations to the Corrective Action Plan for Groundwater

Date Submitted	Request/Change to Corrective Action Plan for Groundwater (GW CAP)	Date Approved by NDEP
8/25/2011	Tetra Tech proposed vertical delineation of contamination through continuous core borings and discrete depth groundwater sampling, per Nevada Division of Environmental Protection (NDEP) comments on the GW CAP.	9/8/2011
7/31/2012	Tetra Tech requested that the Air Sparging/Soil Vapor Extraction (AS/SVE) portion of the pilot test be dropped from the upcoming field work because of unfavorable subsurface conditions, consisting of a caliche layer below the water table that had been confirmed during vertical delineation work.	8/16/2012
8/20/2012	Tetra Tech proposed (1) installation of a deep nested well on the western mall parking lot, (2) installation of two deep nested wells on the eastern mall parking lot, and (3) installation of two deep wells in the Paradise Palms neighborhood.	8/21/2012
10/8/2012	Tetra Tech proposed (1) installation of a deep nested well on the western mall parking lot, (2) installation of two deep nested wells on the eastern mall parking lot, and (3) depending on results from sampling the first three wells, installation of one deep well in the Paradise Palms neighborhood.	10/9/2012

2.0 Field Activities and Results

The GW CAP outlined the field work to be performed, including additional characterization of the extent of PCE-contaminated groundwater, aquifer testing, and bench- and pilot-scale testing. This section summarizes implementation of planned activities, deviations from the plan, and permits to conduct these activities.

2.1 Vertical Delineation

Prior to the work conducted for the GW CAP, the vertical extent of PCE-contaminated groundwater was unknown both near the source area and along the centerline of the plume. This information was needed to help select and design a remedy for groundwater, yet boreholes drilled for previous investigations generally had been limited to a depth of 30 to 40 ft below ground surface (bgs). Therefore, vertical delineation of PCE contamination in groundwater was conducted in the area near well MW-14, on the west side of the Boulevard Mall and immediately downgradient from the source area, and in the eastern parking lot of the Boulevard Mall. Both areas are along the centerline of the PCE plume.

Field work proceeded in three phases:

- Phase I (July 2012): Advancement of boreholes at four locations to depths of up to 60 ft bgs, with continuous core sampling to characterize lithology and to collect depth-discrete groundwater samples at 5-foot intervals from the water table to the total depth of the borehole.
- Phase II (January 2013): Advancement of boreholes at three locations to 100, 104, and 120 ft bgs, with continuous core sampling to characterize lithology and to collect depth-discrete groundwater samples at 10-foot intervals from the water table to the total depth of the borehole.
- Phase III (March 2013): Advancement of one borehole to a depth of 60 ft bgs to collect discrete groundwater samples at 50 and 60 ft bgs.

Phase I field work provided information on the vertical distribution of PCE and lithology throughout the saturated zone. This information allowed selection of appropriate target intervals for the upcoming pilot tests. However, significant concentrations of PCE (as much as 1,100 µg/L) were detected at 60 ft bgs, the total depth of drilling during Phase I. Therefore, additional vertical delineation was performed during Phase II. Groundwater and soil data collected during Phase II showed decreasing concentrations of PCE with increasing depth, down to nondetectable levels at about 80 ft bgs (Table 2-1-1). During Phase III, supplemental, depth-discrete grab samples of groundwater were collected during drilling for pilot test wells.

Table 2-1-1 summarizes information from the three phases of vertical delineation, and the following sections discuss sampling procedures and results.

TABLE 2-1-1: Analytical Data from Groundwater Samples from Vertical Delineation

BORING ID	MW-6D	MW-14I		B-4		MW-19D		PIP		MW-19I		MW-20D		CMT-1

Notes:

Depth-discrete groundwater samples were collected during field activities in July 2012, January 2013, and March 2013.

Depth to GW	Approximate depth of first groundwater encountered during drilling
*	Not sampled due to insufficient recharge
**	Sampler got unplugged
--	Interval not sampled
[a]	Sample was collected with stainless steel bailer
[b]	Based on soil sample result
[c]	Primary and duplicate sample results
ft bgs	Feet below ground surface
µg/L	Micrograms per liter
ND	Not detected
PCE	Tetrachloroethene
[PCE]	PCE concentration
PIP	Potassium permanganate injection point

2.1.1 Continuous Soil Coring and Depth-Discrete Groundwater Sampling

Phase I (July 2012) – HSA Drilling

During Phase I field activities, a hollow stem auger (HSA) drilling rig was used to advance three boreholes within the parking lot east of Boulevard Mall (B-4, MW-19I, and CMT-1), and one west of the Boulevard Mall near well MW-14 (MW-14I). At each location, a split-spoon sampler was used to collect continuous soil core samples.

The split-spoon sampler was advanced into the undisturbed soil beneath the bottom of the casing or borehole using a weighted hammer and a drill rod. The hammer weight, hammer drop, and the number of blows required to advance the split-spoon sampler in 6-inch increments provided information on the density and consistency of the subsurface soil (see blow counts on boring logs for B-4 and MW-19I in Appendix A). After the split-spoon sampler had been driven to its intended depth, it was removed carefully to avoid loss of sample material. After the split-spoon sampler was removed from the casing, it was detached from the drill rod and opened to allow for visual examination and classification of recovered soil. For the first two boreholes, a 2-inch-diameter, 2-ft-long, steel, split-spoon sampler was used for continuous soil coring. However, to expedite drilling and sample collection, a 2-inch-diameter, 5-ft-long, steel, split-spoon sampler was used instead at the third and fourth boreholes (CMT-1 and MW-14I).

West of the Boulevard Mall, at the northwest corner of the west parking garage, where high concentrations of PCE have been measured in groundwater near well MW-14, care was taken to avoid potential cross-contamination while drilling. To minimize the risk of cross-contamination, a 12-inch steel casing was installed after drilling to a depth of 20 ft bgs (anticipated depth to groundwater). The drilling then resumed inside the temporary casing to the final depth of the borehole.

Groundwater samples were collected every 5 ft starting at the top of the saturated zone to the total depth of the borehole. Groundwater samples were collected using a Hydropunch II™ sampler. The sealed-screen sampler was advanced to the targeted sampling depth and the protective outer rod was retracted, exposing the screen to groundwater. The sampler was then left in place to allow groundwater to fill a sample chamber. Depending on the hydraulic conductivity of the lithology encountered at the targeted sampling depth, sample collection could take from 15 minutes to more than 1 hour. The sampler was then retrieved and the sample transferred into three 40-milliliter volatile organic analysis (VOA) vials for laboratory analysis. Drilling resumed and the borehole advanced to the next targeted sampling depth. The sampler and drive rod were decontaminated before being re-introduced into the borehole to collect another groundwater sample.

Groundwater samples from Phase I boreholes MW-14I, B-4, MW-19I, and CMT-1 were collected every 5 feet from 30 to 60 ft bgs (Table 2-1-1). However, the deepest groundwater sample from borehole MW-14I was collected at 55 ft bgs, because the borehole was terminated at the top of clay layer to minimize potential for PCE-contaminated water to migrate downward through this layer.

A total of 22 depth-discrete groundwater samples were collected from four boreholes during Phase I. Five samples could not be collected because the volume of water extracted was insufficient or the sampler malfunctioned. Analytical results (Table 2-1-1) indicate non-uniform distribution of dissolved PCE over depth, with the highest concentration of 7,600 µg/L PCE in monitoring wells at and near the location of the former dry cleaners. PCE concentrations in groundwater at the bottom of boreholes ranged from 700 to

1,700 µg/L. This suggested that PCE contamination could extend deeper than 60 ft bgs and led to Phase II of vertical delineation.

Phase II (January 2013) – Sonic Drilling

Using a sonic drill rig, two borings (MW-19D and MW-20D) were advanced to 100 and 104 ft bgs within the parking lot east of Boulevard Mall, and one boring (MW-6D) was advanced to 120 ft bgs west of the Boulevard Mall near well MW-14. Sonic drilling was chosen because of the anticipated depth of investigation and the need to retrieve continuous soil cores. In addition, telescoping sonic drill casing advancement allowed drilling through multiple water bearing units without risking cross-contamination.

The sonic drill head is a hydraulically activated unit that conveys high-frequency vibrations to a drill string to achieve cutting action at the bit face. The cutting action forces a continuous core of the formation up into the drill string. During this investigation, continuous cores were retrieved from each borehole as 10-ft-long sections. Occasionally, vibrations from sonic drilling produced cores that were very hot, especially when retrieved from dense or consolidated layers such as caliche. However, such heating was generally observed only at shallow depths in the unsaturated zone. Heating in the saturated zone was insignificant and not likely to have affected groundwater samples.

Soil core recovery rates were 80 to 100 percent, except for a few sections of boreholes MW-6D and MW-20D (see boring logs in Appendix A) where recovery was poor. This occurred when materials encountered became increasingly liquefied when the driller hammered in the temporary casing after several unsuccessful attempts.

Both SimulProbe® and Hydropunch II were used to collect depth-discrete groundwater samples. SimulProbe® is capable of concurrently sampling soil and groundwater. The SimulProbe was driven to a target depth, and the drive shoe was mechanically retracted from the soil sample container, exposing the screened fluid entry ports for groundwater sampling. Groundwater samples were collected by first pressurizing the water canister with nitrogen gas to prevent ambient groundwater from entering the tool as it was driven to sampling depth. Upon achievement of target depth, the pressure in the canister was released to allow groundwater to fill the canister through a one-way valve at the base of the canister.

Groundwater samples collected below 60 ft bgs were analyzed off site in the lab with quick turnaround because the results would determine whether drilling should continue. The plan was to advance the borehole and collect depth-discrete groundwater samples to a depth not to exceed 100 feet (in the Eastern Parking Lot area) or 200 feet (west of the Boulevard Mall area) or until PCE concentration measured was below 100 µg/L at three consecutive depths. SimulProbe was used to sample borehole MW-20D, and only two out of six attempts to collect groundwater samples were successful, despite waiting 1 hour for each sample to collect. Therefore, Hydropunch II was used to sample the next borehole, MW-19D. However, this did not prove much better, so the SimulProbe sampler was re-engaged to collect a soil sample if a groundwater sample could not be collected. In one case, when a groundwater sample could not be collected, a soil sample was collected at 81 ft bgs and sent to the lab to be analyzed for PCE.

Groundwater samples from Phase II boreholes MW-6D, MW-19D, and MW-20D were collected from 27 to 121 ft bgs (Table 2-1-1). A total of 16 depth-discrete groundwater samples were collected from three boreholes during this event; nine samples could not be collected because of extremely slow groundwater recovery from the formation. Analytical results (Table 2-1-1) indicate PCE in the upper 20 ft of the saturated zone at concentrations as high as 1,100 µg/L, but at decreasing concentrations below about 70 ft bgs, and absent or at very dilute concentrations below 81 ft bgs. Therefore, Phase II field activities appear to have been successful in delineating the vertical extent of PCE in the shallow groundwater.

Phase III (March 2013) – HSA Drilling

Additional depth-discrete groundwater samples were collected while pre-drilling the 60-ft-deep borehole to be used for injection of permanganate in the pilot test. The Hydropunch II sampler was used to collect depth-discrete groundwater samples from 51 and 61 ft bgs. However, after 2 hours, only the sample from 51 ft bgs had sufficient volume for analysis; thus no sample was collected from 61 ft bgs. PCE in groundwater at 51 ft bgs was detected at a concentration of 900 µg/L (Table 2-1-1).

2.1.2 Soil Sampling for Physical and Chemical Parameters

During Phase I and II field activities, soil samples were collected and analyzed for moisture content, bulk density, total porosity, hydraulic conductivity, grain size distribution, and total organic carbon (TOC) content. In addition, two composite samples were collected from two boreholes (MW-19I and CMT-1) within the parking lot east of the Boulevard Mall and analyzed for permanganate NOD, to calculate the amount of potassium permanganate needed to overcome the NOD.

Soil samples were collected from discrete depths in boreholes using a thin-walled tube sampler (Shelby tube). The Shelby tube was pushed to the desired depth and then rotated to collect an undisturbed soil sample. The retrieved 2-foot-long tube with soil sample was sealed with plastic caps and sent to PTS Laboratories, Inc., for soil analyses. The summary of laboratory results from five soil samples collected from boreholes at various depths in the saturated zone appears in Table 2-1-2. The details of analyses, including analytical methods, are provided in Attachment 4.

Soil samples were collected from approximately 38 to 81 ft bgs, and contained varying amounts of coarse and fine-grained soils (Table 2-1-2). Silt and clay content in samples ranged from approximately 22 to 72 percent, while sand and gravel content ranged from 28 to 78 percent. Moisture content in samples measured from 17 to 61 percent by weight. Dry bulk density ranged from 0.88 to 1.53 grams per cubic centimeter (g/cm^3), and total porosity was measured at 38-66 percent. Hydraulic conductivity values ranged from 0.01 to 0.35 ft per day, with the lower values representing fine-grained soils (silts, sandy silts), and the higher values representing sandy soils (fine sand, silty sand).

TOC content ranged from 270 to 750 milligrams per kilogram (mg/kg), which is relatively low, but not unexpected for soil samples in a desert environment with little history of vegetation. Expressed as fraction of organic carbon (foc), the average foc is less than 0.001, which indicates limited sorption of PCE to soil organic carbon.

Permanganate NOD sampling and analyses were part of bench-scale testing and are discussed in Section 2.3.

TABLE 2-1-2: Summary of Soil Properties

BORING ID	Depth (ft bgs)	Grain Size Description*	Gravel (%)	Sand (%)	Silt & Clay (%)	Moisture Content (% weight)	Dry Bulk Density (g/cm^3)	Total Porosity (%)	Hydraulic Conductivity (cm/sec)	TOC (mg/kg)
MW-14I	52	Fine Sand/Clayey Silt Mixture	0	40.6	59.4	17.3	1.66	37.8	0.014	660

mg/kg	Milligrams per kilogram

2.1.3 Monitoring Well Installation

Three of the four Phase I investigative boreholes and all three Phase II investigative boreholes were converted to monitoring wells. Three wells were installed in Phase I (MW-14I, MW-19I, and CMT-1), and three triple-nested wells were installed in Phase II (MW-6D1/D2/D3, MW-19D1/D2/D3, and MW-20D1/D2/D3). Boring B-4 was abandoned in accordance with *Nevada Administrative Code* (NAC) 534, Underground Water and Wells.

Wells MW-14I and MW-19I were designed to function as pumping wells for aquifer tests (see Section 2.2). They were constructed of 4-inch-diameter schedule 40 polyvinyl chloride (PVC) casing with 0.010-inch slotted screens. The third well, CMT-1, was to be used as one of the observation wells for the aquifer test. It was constructed using the Seven-Channel continuous multi-channel tubing (CMT) system. The Seven-Channel CMT system, a 1.7-inch outer diameter polyethylene tube with seven screens, each 6 inches long, spaced 5 feet apart on centers, was installed into an 8-inch-diameter borehole. The tops of screens were positioned 30, 35, 40, 45, 50, 55, and 60 ft bgs. Each screen was accessed through one of seven ports at the top of the CMT riser.

Three triple-nested wells were installed on the Boulevard Mall Property during Phase II. Well MW-6D1/D2/D3 had a total depth of 110 feet, and wells MW-19D1/D2/D3, and MW-20D1/D2/D3 had total depths of approximately100 ft. The wells were designed to monitor shallow, intermediate, and deep groundwater, and for observation of the pilot tests.

All wells were developed using several cycles of surging, bailing, and pumping. Well construction details are summarized in Table 2-1-3. Appendix A provides well construction logs.

2.2 Aquifer Testing

The purpose of aquifer tests was to estimate the hydraulic properties such as hydraulic conductivity, transmissivity, and storage coefficient for geologic materials at the site, and also to provide additional information on site hydrogeology. The test setup, procedures, and interpretation of the results are detailed in Appendix B. This section briefly discusses the aquifer test procedures and summarizes test results. It also discusses the applicability of the aquifer test results for the interpretation of the pilot tests, as well as the implications for the groundwater remedy selection.

In July and August 2012, Tetra Tech conducted pumping tests west of the Boulevard Mall near well MW-14 and the parking lot east of Boulevard Mall The Boulevard Mall property lies immediately downgradient of the former Maryland Square Shopping Center, which housed the former dry cleaners.

2.2.1 Details of the Aquifer Testing

Test setup, procedures, and interpretation of results are detailed in Appendix B. This section briefly discusses the aquifer test procedures and analyzes the results.

Aquifer testing included a step-drawdown test and a constant-discharge test at each tested location. The step-drawdown tests determined the optimum pumping rates for the constant-discharge pumping tests that followed. The constant-discharge tests commenced after water levels had returned to static conditions.

Flow rates in the pumped wells were monitored throughout the test and maintained at the target rate by operating a flow control valve. Water levels in the pumped wells and the observation wells were measured both manually and automatically. Vented (gauged) pressure transducers were used for automated measurements. Water level recovery was monitored after pumping stopped. Water produced by the tests was treated and stored on the Boulevard Mall property in temporary fractionation tanks. The water was then sampled and analyzed for compliance with the permit prior to discharge into a storm sewer (see Appendix B).

MW-19I was used as the pumping well for the step-drawdown and constant-discharge tests in parking lot east of Boulevard Mall. MW-19 was an observation well for both tests, Wells MW-20 and CMT-1 were observation wells only for the constant-discharge test. Pressure transducers were used to measure water levels in observation wells MW-19 and MW-20. Additionally, water levels were measured manually in six of seven ports in well CMT-1. An obstruction prevented measurement in the deepest port The cumulative drawdown at the end of the step test was approximately 10 ft in the pumping well, and 0.04 ft in the nearest observation well MW-19 (40 feet away). At the end of the 72-hour constant-discharge test, the drawdown was approximately 4 ft in the pumping well, and ranged from 0.03 to 0.04 ft in the three observation wells 40, 81, and 92 feet away.

MW-14I was used as the pumping well for the step-drawdown and constant-discharge tests west of the Boulevard Mall near well MW-14. MW-14 was an observation well for both tests, Wells MW-6 and MW-13 were used as observation wells only for the constant-discharge test. Water levels in all wells were measured using pressure transducers. The cumulative drawdown measured at the end of the step-drawdown test was approximately 10 ft in the pumping well and 0.07 ft in MW-14, the nearest observation well, located 40 feet away. At the end of the 77-hour constant-discharge test, the drawdown was approximately 13 ft in the pumping well, and ranged from 0.11 to 0.23 ft in the three observation wells located 231, 81, and 40 feet away.

Step-drawdown test data were used to determine the optimal pumping rate for the constant rate pumping tests and to calculate specific capacity and efficiency. Specific capacity expresses the well yield per unit of drawdown (Driscoll 1995). The estimated maximum specific capacity was 0.09 gallons per minute per foot of drawdown (gpm/ft) for MW-14I and 0.16 gpm/ft for MW-19I. The estimated well efficiency for each pumping well decreased from 74 to 60 percent when pumping rates increased from approximately 1 to 1.9 gpm. Both wells were expected to be most efficient when pumping at approximately 1 gpm. Therefore, a rate of 1 gpm was selected for the constant-discharge tests west of the Boulevard Mall near well MW-14 and the parking lot east of Boulevard Mall.

2.2.2 Analysis and Interpretation of Aquifer Test Data

The test data were interpreted using AQTESOLV version 4.5 (HydroSolve 2007), an aquifer test solution program. The water level input data did not require correction for barometric pressure fluctuations because vented pressure transducers were used. The AQTESOLV program calculated transmissivity (T) and storage coefficient (S) by comparing the observed time-drawdown data to theoretical standard curves (type curves) associated with known T and S. Hydraulic conductivity (K) was calculated by dividing T by the aquifer thickness (b).

As can be seen from the cross sections (see Figures 4, 5, 6, and 7), the lithology and hydrogeologic conditions near the pumping wells resemble a confined or leaky confined aquifer. Moreover, during drilling to install the pumping wells, groundwater was first encountered a few feet lower than the piezometric heads in the wells that were subsequently installed. This indicated that shallow groundwater may be under pressure at those locations, which would be consistent with a confined or leaky confined situation. Therefore, the Theis (1935)/ Hantush (1961) solution for a pumping/recovery test with a constant discharge rate in a confined aquifer with partial penetration was used for data analysis. Some data sets were also evaluated using the Hantush (1960) solution for a pumping/recovery test in a leaky confined aquifer without storage in adjacent aquitards. However, in the majority of cases, the Theis/Hantush solution for a confined aquifer better fit the field data.

Based on results of the step-drawdown and constant-discharge tests in the parking lot east of Boulevard Mall, the average transmissivity, storage coefficient, and hydraulic conductivity of the saturated zone are estimated at T= 64 ft^2/day, S = 0.0017, and K = 2.1 ft/day. Assuming a 30-ft thick saturated zone, the estimated hydraulic conductivity ranged from K = 1.1 to 3.4 ft/day, which is characteristic of silty sand and fine sand (Heath 1983, Domenico and Schwartz 1998). The average vertical to horizontal hydraulic conductivity anisotropy ratio (K_z/K_r) is estimated at approximately 0.005, indicating that the vertical permeability of the material is 200 times lower than its horizontal permeability. Despite the relatively weak response of the observation wells to pumping, the time-drawdown data from MW-19 and the recovery data for the pumping well increased confidence in the estimated parameters.

Based on results of the step-drawdown and constant-discharge tests west of the Boulevard Mall near well MW-14 , average T, S, and K of the saturated zone are estimated at T = 146 ft^2/day, S = 0.0009, and K = 4.2 ft/day. Assuming a 35-ft thick saturated zone, the estimated K ranged from 0.4 to 9.4 ft/day, which is characteristic of silty sand to medium clean sand (Heath 1983, Domenico and Schwartz 1998). The average K_z/K_r for the saturated water-bearing zone is estimated at approximately 0.013, indicating that the vertical permeability of the zone is nearly 100 times lower than its horizontal permeability.

2.2.3 Summary and Conclusions for the Aquifer Test Results

Conclusions from the step-drawdown and constant-discharge tests in the parking lot east of Boulevard Mall and west of the Boulevard Mall near well MW-14 are as follows:

1. The formation in which the pumping wells are screened produces relatively low well yields, as indicated by specific capacities ranging from 0.07 to 0.16 gpm per foot of drawdown. This means wells screened in the shallow water-bearing zone would produce water at very low flow rates, making them impractical for use in groundwater extraction for hydraulic control of PCE mass removal.

2. The average T ranges from 64 to 146 ft^2/day, and the average aquifer S ranges from 0.0009 to 0.0017. Therefore, wells screened in the shallow water-bearing zone would have excessive drawdowns even at low pumping rates, rendering them inefficient for groundwater extraction.

3. The average K of the shallow water-bearing zone ranges from 2.1 to 4.2 ft/day, corresponding to silty sand and sand, indicating moderate permeability. However, moderate permeability soils are likely present in the subsurface as thin disconnected lenses which would not support significant well yields.

These estimates of K are consistent with the results of slug tests conducted in a number of wells, including MW-13, MW-19, and MW-20, as summarized in Section 3.1.3.

Based on estimates of average K and observed hydraulic gradients, the horizontal groundwater seepage velocity at the Site is estimated to range from 40 to 100 ft/yr, with higher velocities associated with sand lenses of limited extent. Considering the low organic carbon content of tested soils (see Section 2.1.2), advective transport of PCE is expected to be only slightly retarded by sorption to soil. Therefore, within the test areas, the advective velocity of dissolved PCE is expected to range from 30 to 70 ft/yr. Section 3.2.1 further discusses groundwater seepage velocity and PCE transport.

2.3 Bench-Scale Testing

Representative soil samples from the proposed pilot test area were collected and tested for the 48-hour permanganate NOD. This information was necessary to calculate the permanganate dose for the pilot test. The representative samples were collected from saturated zone soil cores from the MW-19I and CMT-1 boreholes.

The first sample (TTEW201PNOD3059) was collected on July 19, 2012. It was a composite of material from 30 to 59 ft bgs at MW-19I. The sample was placed in three 8-ounce glass jars and refrigerated. The second sample (TTMW4001PNOD2955) was collected on July 23, 2012. It was a composite of material from 29 to 55 ft bgs at CMT-1. The sample was placed in four 8-ounce glass jars. Both samples were shipped to Carus Corporation's (Carus) customer service laboratory in LaSalle, Illinois, on July 23, 2013, for next day delivery.

Carus tested the samples in accordance with ASTM International (ASTM) D7262-07 Test Method A. Each sample was tested in triplicate. The soil was baked at 105°C for 24 hours, and then allowed to cool to room temperature. The soil was then blended and passed through a U.S. 10 sieve (2-millimeter [mm]). The reactors were loaded with 50 grams of soil and 100 milliliters (mL) of 20 grams per liter (g/L) potassium permanganate solution making up 40 grams per kilogram (g/kg) potassium permanganate by dry weight of soil. The reaction vessels were inverted once to mix the reagents. After 48 hours, the residual permanganate ion concentrations in the samples were measured and used to calculate the potassium permanganate demand on a dry weight basis.

The results were reported on August 1, 2012. The permanganate NOD of the first sample varied from 0.22 to 0.54 g/kg, and the permanganate NOD of the second sample varied from 0.37 to 0.52 g/kg. The average permanganate NOD for both samples was reported at 0.4 g/kg. This is considered a low value,

and soil with low NOD is conducive to remediation by chemical oxidation. The bench-scale test is detailed in Attachment 1.

2.4 Potassium Permanganate Injection Pilot Testing

Potassium permanganate pilot testing was conducted in the eastern parking lot of the Boulevard Mall, using wells MW-19, MW-19I, and MW-19D1 to monitor the test. Locations of these three wells in relation to the potassium permanganate injection point are shown on Figure 8. MW-19 is approximately 15 ft upgradient of the injection point and screened from19 to 34 ft bgs; MW-19D1 is approximately 10 ft crossgradient of the injection point and is screened from 31 to 51 ft bgs; MW-19I is approximately 25 ft downgradient of the injection point and is screened from 34 to 54 ft bgs.

Injection was conducted under a short-term underground injection control (UIC) general permit issued by NDEP's Bureau of Water Pollution Control on March 8, 2013, and revised on March 14, 2013 (Appendix E). In addition, a Temporary Hazardous Materials Storage Permit was obtained from the Clark County Fire Department (Appendix E).

2.4.1 Field Activities

Cascade Drilling provided drilling and injection services for the pilot test. Caliche in the subsurface would have prevented injection via direct-push drilling. Therefore, on March 6, 2013, the potassium permanganate injection point was pre-drilled with a 6-inch HSA to a depth of 62 ft bgs (see boring log in Appendix A). A fairly competent confining clay layer was found at approximately 60 ft bgs. The borehole was then backfilled with sand from approximately 62 to 20 ft bgs, followed by hydrated bentonite chips from approximately 20 ft bgs to the surface. The daily field reports are in Appendix C.

A 2 percent permanganate solution by weight was prepared by mixing 3,370 pounds of solid potassium permanganate (RemOx-S as supplied by Carus) with 20,000 gallons of water. A direct-push drill rig was used to inject the permanganate solution in a top-down approach. The potassium permanganate solution was injected into the shallow water bearing zone in 2-foot, discrete, vertical intervals starting at 20 ft bgs and ending at 60 ft bgs. Injection began on March 11, 2013, and ended on March 21, 2013. Approximately 1,020 gallons of the potassium permanganate solution was injected into each 2-foot interval. A summary of the injection data is in Table 2-4-1.

Bailers were used to collect groundwater samples from observation wells to detect potassium permanganate breakthrough. Potassium permanganate was observed in monitoring well MW-19D1 approximately 1 hour after the injection began. Potassium permanganate was observed in monitoring well MW-19 approximately 1.5 hours after injection began. Consistent with the proximity of MW-19D1 to the injection point, permanganate appeared more concentrated there, as evidenced by the dark purple color of groundwater. Permanganate was not seen in deeper screened intervals (MW-19D2 and MW-19D3) at this location, suggesting that the permanganate solution had travelled from the injection point somewhat horizontally. In monitoring well MW-19I, potassium permanganate was seen 1 week after injection began.

Injection pressure and flow rate were recorded as injection progressed. Injection data are summarized in Table 2-4-1 and detailed in Attachment 2. Injection pressure and flow rate were carefully controlled to limit the potential for hydraulic fracturing. Instantaneous flow rate and pressure were measured using an inline flow meter and a pressure gauge at the drill rig (see photograph 13 in Appendix D). Average flow rate was confirmed by measuring the time required to empty known volumes of permanganate storage tanks. The UIC permit originally limited flow rate to 10 gpm, but this limit was raised to 20 gpm by permit modification because of the low injection pressures observed at the start of the pilot test (Appendix E).

After injection was complete, the borehole was grouted with a cement-bentonite slurry in accordance with Nevada regulations.

Two borings were advanced near the injection point to determine the uniformity of potassium permanganate migration through the formation (Figure 8). Both borings were advanced to a total depth of 60 ft bgs. Boring SB-01 was advanced 8 feet to the north of the injection point and boring SB-02 was advanced 6 feet to the east of the injection point. Appendix A presents the boring logs.

TABLE 2-4-1: Potassium Permanganate Injection Operating Parameters						
Date	Zone	Interval	Potassium Permanganate Volume Injected (gallons)	Average Injection Rate (gpm)	Average Pressure (psi)	Notes
3/11/2013	Zone 1	20-22	450	3.8	0.0	At 1447, ISCO treatment began. Oxidant observed in crossgradient and upgradient monitoring wells within 1 and 1.5 hours, respectively. Continue ISCO of Zone 1 tomorrow.
3/12/2013	Zone 1	20-22	566	4.7	0.0	Finished injection in Zone 1. Groundwater sample collected from MW-19D1. To neutralize, the destruction of PCE samples were quenched with sodium thiosulfate.
3/12/2013	Zone 2	22-24	1020	5.4	1.9	Maximum injection rate of 8 gpm with pressure at the wellhead <5 psi. Groundwater sample collected from upgradient well MW-19.
3/12/2013	Zone 3	24-26	1050	7.2	5.5	psi readings of 10 and greater after 250 gallons, so rods were removed to clean the screen of the injection tool and then redeployed.
3/13/2013	Zone 4	26-28	1008	9.8	4.2	Peak pressure observed at 5.0 psi over 1 hr and 53 minutes of injection
3/13/2013	Zone 5	28-30	1000	10.0	<2	Peak pressure observed at 6.0 psi over 1 hr and 30 minutes of injection
3/13/2013	Zone 6	30-32	1050	7.6	13.7	Peak pressure observed at 28 psi over 2 hours and 45 minutes of injection.
3/13/2013	Zone 7	32-34	750	3.3	24	Peak pressure observed at 26 psi over 3 hours of injection. One raw product sample of permanganate solution was submitted to the lab. Continue ISCO of Zone 7 tomorrow.
3/14/2013	Zone 7	32-34	300	9.2	15	Peak pressure observed at 32 psi over 1 hour and 15 minutes of injection.
3/14/2013	Zone 8	34-36	1050	2.5	<30	Peak pressure observed at 40 psi over 6 hours of injection.
3/14/2013	Zone 9	36-38	250	2.5	<25	Peak pressure observed at 40 psi over 6 hours of injection.
3/15/2013	Zone 9	36-38	1050	7.2	30	Complete ISCO of Zone 9. Peak pressure observed at 30 psi over 6 hours of injection.
3/15/2013	Zone 10	38-40	1050	5.5	26.5	Peak pressure observed at 30 psi over 5 hours of injection.
3/18/2013	Zone 11	40-42	1050	5.7	7	Perform a "falling head" test to ensure proper equipment operation after weekend down time. Peak pressure observed was greater than 60 psi sustained for less than 2 minutes. Zone 11 was completed in 5.5 hours of injection.
3/18/2013	Zone 12	42-44	1050	10.0	13	Peak pressure observed 20 psi over 2 hours of injection. Oxidant was observed in downgradient well MW-19I at 1256 during injection into Zone 12.
3/18/2013	Zone 13	44-46	1050	8.3	16	Peak pressure observed at 21 psi over 2 hours of injection.
3/19/2013	Zone 14	46-48	1050	7.5	25	Peak pressure observed at 30 psi over 2 hours of injection.

TABLE 2-4-1: Potassium Permanganate Injection Operating Parameters						
Date	Zone	Interval	Potassium Permanganate Volume Injected (gallons)	Average Injection Rate (gpm)	Average Pressure (psi)	Notes
3/19/2013	Zone 15	48-50	1050	8.6	25	Peak pressure observed at 32 psi over 2 hours of injection.
3/19/2013	Zone 16	50-52	1050	6.5	28	Peak pressure observed at 40 psi intermittently during the final 250 gallons. Zone 16 was completed in 2 hours. Collected groundwater samples from downgradient well MW-19I.
3/20/2013	Zone 17	52-54	1050	6.1	29	Peak pressure observed at 32 psi over 2 hours and 42 minutes of injection.
3/20/2013	Zone 18	54-56	1039	3.0	28.5	Peak pressure observed at 36 psi over 2 hours of injection.
3/20/2013	Zone 19	56-58	1050	5.8	28	Peak pressure observed at 35 psi over 2 hours and 30 minutes of injection. Collected groundwater recovery data from MW-19I and MW-19D3.
3/20/2013	Zone 20	58-60	1050	3.9	30	Peak pressure observed at 34 psi over 4 hours of injection. End permanganate injection.

2.4.2 Monitoring

Monitoring wells MW-19I, MW-19D1, and MW-19 were sampled before (March 8), during (March 12 and 19), and after (March 26, April 4, April 11, and May 2) injection. Groundwater was sampled using a low flow sampling method following NDEP guidance (NDEP 2007). The samples were analyzed for volatile organic compounds (VOC) via EPA Method 8260, for dissolved metals (field filtered) via EPA 3010A and 6020, for cations/anions via chromatography, and for potassium permanganate via colorimetry. Samples for VOC analysis collected during and after injection were quenched with sodium thiosulfate to prevent destruction of analytes after sample collection.

Analytical results are listed in Table 2-4-2, and are discussed below. Field parameters were measured more frequently and are presented in Table 2-4-3.

Wells MW-19D2 (screened from 60 to 70 ft bgs) and MW-19D3 (screened from 90 to102 ft bgs) were sampled before injection commenced. Permanganate was not likely to enter these wells because their screens lie within and below a competent clay layer, and below the maximum depth of injection (60 ft bgs). These wells were sampled, but the samples were not analyzed because there was no visible evidence of permanganate; field parameters measured are listed in Table 2-4-3.

After injection was complete, two investigative boreholes were advanced approximately 6 ft east (downgradient) and 9 ft north (crossgradient) of the injection point. The boreholes were advanced to assess the uniformity of potassium permanganate distribution around the injection point. Continuous cores were collected and logged for permanganate staining. The boreholes were subsequently grouted with a cement-bentonite slurry in accordance with Nevada regulations. Findings of the investigation are discussed below.

TABLE 2-4-2: Potassium Permanganate Injection Pilot Test Analytical Results

Well ID	Date	Volatile Organics by 8260B (µg/L)		Dissolved Metals (field filtered) by EPA 3010A and 6020			Cation/Anion Analysis by Chromatography		Colorimetry

2.4.3 Results

This section discusses the results of the potassium permanganate pilot test. Analytical results are listed in Table 2-4-2, and field parameters are presented in Table 2-4-3. Figure 9 shows PCE response to the pilot test.

PCE Response

Decreased concentrations of PCE corresponded with visual detection of potassium permanganate in the three observation wells. Baseline concentrations of PCE ranged from 300 to 780 µg/L. In the crossgradient well MW-19D1, the PCE concentration decreased to 9.4 µg/L 1 day after the start of injection, and decreased concentrations of PCE were detected for at least a month after injection. In the upgradient well MW-19, PCE concentrations decreased immediately from the 520 µg/L baseline to 390 µg/l, Two weeks after injection, PCE concentration was 14 µg/L. In the downgradient well MW-19I, concentrations of PCE decreased 1 week after the start of injection and continued to decline for the remainder of the test; 7 weeks after initial injection, a PCE concentration of 0.6 µg/L was detected.

As potassium permanganate concentrations decreased, concentrations of PCE rebounded, possibly due to influx of contaminated groundwater and desorption from soil. MW-19 being upgradient of the injection point was the first to experience rebound. PCE concentration in this well started to increase just 3 weeks after injection commenced, and 4 weeks later, the concentration increased to 810 µg/L. In MW-19D1, PCE concentrations started increasing after a month; however, concentrations continued to be less than the baseline concentration in this well.

TCE Response

TCE concentrations followed a pattern of decrease and rebound similar to that of PCE, as seen in Table 2-4-2. Baseline concentrations of TCE were detected in all wells, and initial concentrations ranged from 2.9 to 5.2 µg/L. After injection, TCE was not detected in any of the observations wells. In the downgradient well, MW-19I, TCE was not detected for the duration of the test. In MW-19D1, TCE concentration rebounded slightly to 0.83 ug/L 1 month after injection; 7 weeks after initial injection, a TCE concentration of 0.53 µg/L was detected. In MW-19, 7 weeks after injection, a TCE concentration of 2.2 µg/L was detected.

Metals Response

Soils can contain metals that transform to more soluble species when oxidized. Potassium permanganate is likely to oxidize some metals, rendering them more soluble. Increases in metals concentrations resulting from injection of oxidant are expected to be localized and temporary. Arsenic concentrations did not change significantly. Dissolved chromium concentrations increased in all three observation wells after potassium permanganate injection, and subsequently decreased. Pre-treatment concentrations of chromium ranged from 2.8 to 17 µg/L. Concentrations of chromium in two of the samples exceeded the MCL for chromium of 100 µg/L. The highest concentration of chromium observed during testing was 170 µg/L in MW-19I on April 4, 2013. Seven weeks after the potassium permanganate injection, chromium concentrations had decreased in all observation wells, with concentrations ranging from 1.9 µg/L to 43 µg/L. Concentrations of chromium in MW-19I are expected to decrease further as potassium permanganate concentration decreases and chromium returns to a lower oxidation state.

Concentrations of manganese increased during testing because potassium permanganate contains manganese. Initial manganese concentrations ranged from non-detect to 170 µg/L. The highest manganese concentration observed was 360,000 µg/L in MW-19D1 on March 12, 2013. No MCL has been established for manganese; however, the secondary drinking water standard is 50 µg/L.

Seven weeks after the potassium permanganate injection, manganese concentrations approached the baseline in wells where potassium permanganate was no longer present. Concentrations of manganese in MW-19I were still high, indicating presence of potassium permanganate. As with wells MW-19 and MW-19D1, manganese concentration will decrease as the potassium permanganate is flushed out or reduced to manganese dioxide, which is insoluble.

Investigative Borings

Soil cores from the northern boring (SB-01) were stained with potassium permanganate from 25 to 35 ft bgs, and from 55 to 60 ft bgs. Soil cores from the eastern boring (SB-02) were stained with potassium permanganate from 26 to 40 ft bgs, and from 48 to 60 ft bgs. Staining was intermittent between 36 and 40 feet bgs. There was no staining in the predominantly fine-grained soil between 40 and 48 feet bgs. However, staining was observed in other fine-grained materials outside this interval, including caliche and saturated silty clays. Therefore, no relationship was apparent between the degree of staining and soil type. The method of injection and operational challenges, including injection tool clogging, likely influenced the effectiveness of potassium permanganate delivery into targeted vertical intervals. It may be inferred from the pattern of staining at these two locations that the injected solution was not uniformly distributed in the targeted zone. Consequenly, diffusion would play an important role in vertical distribution of the oxidant.

2.4.4 Summary

ISCO with potassium permanganate successfully decreased PCE and TCE concentrations in the pilot test area. An injection radius of influence (ROI) of 11 ft was observed up to 60 ft bgs, with downgradient effect to at least 29 feet from the injection point. Given that potassium permanganate was detected 29 feet from the injection point just 8 days after injection started, the injection ROI is estimated at approximately 20 feet. Six weeks after completion of injection, PCE concentration remained below 1 µg/L in the downgradient well. PCE concentrations had rebounded in the crossgradient well but were still less than the original concentration, and PCE concentration had rebounded in the upgradient well. Chromium concentrations increased temporarily in the aquifer because of a change in oxidation state.

The potassium permanganate migrated significant distances horizontally through the formation. Some channeling of the potassium permanganate was observed, possibly because of the method of injection. Top-down injection in a pre-drilled hole filled with sand appeared successful although the sand may have allowed the injected solution to migrate outside the targeted vertical interval. Occasional injection tool clogging also impeded progress.

2.5 Hydrogen Peroxide/Ozone Injection Pilot Testing

Hydrogen peroxide/ozone injection (PulseOx) pilot testing was performed within the eastern parking lot of the Boulevard Mall using existing wells MW-20, MW-20D1, and MW-CMT1 as observation wells to monitor the test. Locations of these wells in relation to the newly installed injection well, OS-1, are shown on Figure 8. MW-20 is approximately 27 ft upgradient of the injection point and screened from19 to 35 ft bgs. MW-20D1 and MW-20D2 are approximately 8 ft crossgradient and downgradient of the injection point, and are screened from 31 to 51 ft bgs and 55 to 65 ft bgs, respectively; MW-CMT1 is approximately 18 ft downgradient of the injection well and has seven 0.5-foot screens starting at 30 ft bgs and continuing every 5 ft to 60 ft bgs.

An SVE well, SVE-1, was installed 3 ft from the injection well. Two vapor monitoring wells were installed approximately 45 ft upgradient and downgradient of the injection well to monitor soil gas.

Injection was conducted under a short-term UIC general permit issued by NDEP's Bureau of Water Pollution Control on March 8, 2013, and revised on March 14, 2013 (Appendix E). In addition, a Temporary Hazardous Materials Storage Permit and a Compressed Gas Storage Permit were obtained from the Clark County Fire Department (Appendix E).

2.5.1 Field Activities

Cascade Drilling provided drilling services for the pilot test. Installation of hydrogen peroxide/ozone injection well OS-1 began on March 26 and ended on March 28, 2013. Figure 10 shows typical well construction details. OS-1 consists of two pairs of injectors, with each pair targeting a specific transmissive zone. A pair of injectors consists of one hydrogen peroxide injector and one ozone injector separated by a layer of bentonite that is at least 2 ft thick. The two injector pairs are separated by a thicker layer of cement-bentonite grout. Each injector screen is embedded in sand. The shallow hydrogen peroxide injector screen was set at 27.5 to 30.5 ft bgs, and the shallow ozone injector screen was set at 36.5 to 33.5 ft bgs. The deep hydrogen peroxide injector screen was set at 47 to 51 ft bgs, and the deep ozone injector screen was set at 58 to 61 ft bgs.

The two vapor monitoring wells and one SVE well were installed on March 6 and 7, 2013, to 20 ft bgs, each with 5-ft-long screens. The SVE well was installed as a precaution so that it could be used to control fugitive ozone emissions if necessary. The daily field reports presented in Appendix C detail the installation of these wells.

Groundwater & Environmental Services, Inc. (GES) provided the PulseOx trailer and injection services. The PulseOx trailer was mobilized to the site on April 2, 2013. Figure 11 shows a schematic of the PulseOx system. The system operates by sequentially injecting hydrogen peroxide and a mixture of ozone, oxygen, and air. The ozone/air sparge phase helps distribute the hydrogen peroxide in the formation. Ozone destroys PCE and reacts with hydrogen peroxide to produce hydroxyl free radicals which also destroy PCE. Ozone was injected at mass flow rates of 16 and 25 pounds per day. Hydrogen peroxide was injected at 34 percent concentration by weight at an average mass flow rate of 96 pounds per day. Table 2-5-1 summarizes operational data, and the Figure 13 shows the PulseOx system operating cycles. Operation and maintenance logs are presented in Appendix C.

The system operated intermittently after startup on April 3, 2013, until adjustments were completed on April 4, 2013. From then on, the system operated continuously until May 1, 2013, except during maintenance, system alarms, and groundwater sampling events.

Ozone concentrations were monitored in ambient air within the fenced enclosure of the pilot test area, inside the PulseOx trailer, above and inside well vaults, and inside well casings. Ozone concentrations were measured using a handheld ozone monitor. If the ozone concentration above the well vaults or in ambient air exceeded 0.1 parts per million by volume, the system was shut off until the necessary repairs could be made. Well plugs with rubber seals were initially used to plug groundwater monitoring wells, vapor monitoring wells, and the SVE well. However, ozone degraded the rubber seals faster than expected despite the use of plastic liners to isolate the rubber component. The degraded rubber seals then allowed ozone to leak into the well vaults. Therefore, the original well plugs were all replaced with threaded PVC caps and one well plug with a Viton seal.

2.5.2 Monitoring

Wells MW-20D1, MW-20D2, MW-CMT1, and MW-20 were sampled before injection (March 26, 2013) and during injection (April 4, 10, 22, and May 1, 2013). Groundwater sampling procedures included a low flow sampling method consistent with NDEP methods (NDEP 2007). The samples were analyzed for VOCs via EPA Method 8260, for dissolved metals (filtered) via EPA Methods 3010A and 6020, and for

cations/anions via ion chromatography. Total alkalinity was measured by titration. Well MW-20D3 (screened from 92 to 100 ft bgs) was sampled before injection commenced. Treatment was not likely to reach this well because the screens lie within and below a competent clay layer, and below the maximum depth of injection (60 ft bgs).

Soil gas summa canister samples were collected from SVE-1 and VM-2 before and during the test. Three well volumes were purged from the each well before the soil vapor sample was collected. The samples were analyzed for VOCs via EPA Method Modified TO-15.

Analytical results are presented in Tables 2-5-2 (groundwater) and 2-5-3 (soil gas), and are discussed below. Field parameters were monitored more frequently and are listed in Table 2-5-4.

2.5.3 Results

This section discusses results of the PulseOx pilot test. Analytical results are presented in Tables 2-5-2 and 2-5-3, and field parameters are presented in Table 2-5-4. Figure 12 shows PCE response to the pilot test.

PCE Response

Concentrations of PCE decreased within the test area in MW-20D1, MW-20D2, and MW-CMT1. Baseline concentrations of PCE ranged from 4.7 to 310 µg/L. In MW-20D1, the well closest to the PulseOx injection well, concentrations of PCE measured during testing ranged from 3.5 to 5.5 µg/L. In MW-20D2, screened from 55 to 65 ft bgs, concentrations of PCE measured during testing ranged from 1.1 to 8 µg/L. In MW-CMT1, decreases in concentration of PCE were observed within the screened intervals from 30 to 50 ft bgs; however, the decreases were not consistent across events or the various screened intervals.

During testing, no effect was observed in MW-20, MW-20D3, and the screened intervals of MW-CMT1 at 55 and 60 ft bgs. MW-20 is 27 ft upgradient of the injection point. MW-20D3 is screened from 90 to100 ft bgs, 29 feet below the deepest injector screen, and was therefore expected to be outside the treatment zone. Similarly, the two deepest screened intervals of MW-CMT1, at 55 and 60 ft bgs, showed no decrease in PCE concentration.

TCE Response

Decreases in TCE concentrations were similar to those found in PCE concentrations. TCE concentrations decreased in wells MW-20D1 and within the screened intervals of MW-CMT1 from 30 to 50 ft bgs.

Metals Response

Soils can contain metals that transform to more soluble species when oxidized. Increases in metals concentrations resulting from injection of oxidant are expected to be localized and temporary. Chromium concentrations increased in wells MW-20D1, MW-20D2, and within the screened intervals of MW-CMT1 from 30 to 55 ft bgs. Baseline concentrations of chromium ranged from non-detect to 21 µg/L. During

treatment, chromium concentrations ranged from nondetect to 130 µg/L. Arsenic concentrations did not change noticeably.

Soil Gas Response

Concentrations of PCE in soil gas decreased during treatment. Initial soil gas concentrations in SVE-1 (3 ft from the injection well) and VM-2 (50 ft downgradient of the injection well) were 280,000 µg/m^3 and 190,000 µg/m^3, respectively. Concentrations of PCE in soil gas from these wells decreased between one and three orders of magnitude during the test.

2.5.4 Summary

ISCO with hydrogen peroxide and ozone successfully decreased concentrations of PCE in groundwater during the pilot test. PCE concentrations decreased in MW-20D1, MW-20D2, and MW-CMT1. An ROI of at least 15 ft is estimated at depths up to 50 ft bgs. An ROI of at least 8 ft is estimated at depths up to 60 ft bgs. Chromium was detected at elevated concentrations during treatment.

System operating parameters were not significantly altered during the test because of the short duration, and because optimization was not a testing objective. However, system operation could potentially be improved for more efficient PCE destruction.

3.0 UPDATED CONCEPTUAL SITE MODEL

Elements of the conceptual site model (CSM) have been provided in a series of reports prepared for the Site and are available on-line at NDEP's website (http://ndep.nv.gov/pce/maryland_reports.htm and http://ndep.nv.gov/pce/refines.) These reports develop the CSM based on additional information collected for site geology, hydrogeology, and the vertical delineation of PCE in groundwater throughout the course of this investigation during summer 2012 and winter-spring 2013.

3.1 Physical Characteristics of the Study Area

The Las Vegas Valley covers roughly 1,600 square miles in southern Nevada, with the eastern edge extending to approximately 5 miles west of Lake Mead and the Colorado River. The Valley is bounded by mountain ranges that reach a maximum elevation of almost 12,000 ft above mean sea level (amsl) to the west. Elevation of the Valley floor ranges from about 3,000 ft in the west to 1,500 ft amsl in the east (Zikmund 1996).

Precipitation on the Valley floor averages 4.16 inches per year, as reported by the Western Region Climate Center (WRCC 2010). Most precipitation occurs during the months of July and August and during the winter (Wild 1990). Potential evapotranspiration ranges from 1 to 19 inches per month from winter to summer months (Shevenell 1996). Mountains surrounding the basin may receive as much as 20 inches of precipitation per year, usually as snowfall. Surface water flows in the Valley are tributary to Lake Mead through Las Vegas Wash (Brothers and Katzer 1988).

3.1.1 Regional Hydrogeology

The Valley lies within the Basin and Range Province of the northern Mojave Desert, and is a structural basin filled with 3,000 to 15,000 ft of sediments (Langenheim and others 1998). Groundwater generally flows southeast from recharge areas in the Spring Mountains to the west and the Sheep Range to the north, toward the Las Vegas Wash and Lake Mead (Figure 14) (Leising 2004).

In the western portion of the basin, alluvial fan deposits consist of coarse-grained sand and gravel. In the lowland central and eastern portion of the basin, coarser grained sediments interfinger with finer grained lacustrine and playa deposits (Plume 1984, Leising 2004). Within the east central area of the Valley, which includes the Site, coarser-grained deposits interfinger with layers and lenses of sandy silt, silty sand, clayey sand, sandy clay, and caliche (Plume 1984, Leising 2004). Coarser-grained deposits generally serve as aquifers, whereas silts, clays, and caliche may act as confining layers (Zikmund 1996).

The hydrostratigraphic units of the Valley are presented here as defined by Leising (2004) and illustrated on Figures 14 and 15. The upper unit consisting of a heterogeneous package of sand, silt, and clay sediments within the central and eastern areas of the Valley is termed the Las Vegas Wash Aquitard. Based on well logs on file with Nevada Division of Water Resources (NDWR), this unit may be 100 ft thick in the area of the Site. The Maryland Square PCE plume lies within the Las Vegas Wash Aquitard, but has been studied mostly within the upper 30 to 50 ft across the Site, except at two areas west and east of Boulevard Mall where depth of investigation ranged from 60 to 120 ft bgs.

As shown on Figure 16, the Las Vegas Springs Aquifer underlies the Las Vegas Wash Aquitard and is subdivided into an upper unit (Las Vegas Creek Aquifer), a middle unit (Twin Lakes Aquitard), and a lower unit (La Madre Mountain Aquifer). The Las Vegas Creek Aquifer serves as the primary supply to domestic wells, and the La Madre Mountain Aquifer serves as the primary source for municipal supply wells. Based on well logs on file with NDWR, depths to upper and lower units of the Las Vegas Springs Aquifer within a few miles of the Site are an estimated 100 to 200 ft bgs for the Las Vegas Creek Aquifer, and 550 to at least 750 ft bgs for the La Madre Mountain Aquifer. The Duck Creek Aquifer underlies the Las Vegas Springs Aquifer.

Recharge to the shallow groundwater system (i.e., the Las Vegas Wash Aquitard) is attributed to: (1) upward vertical flow from the Las Vegas Springs Aquifer, (2) surface infiltration of runoff, and (3) over-irrigation (either agricultural or residential) (Bernholtz 1993). However, in some areas where water supply wells produce from the deeper aquifer, the vertical gradient has been reversed downward, and in some cases, shallow groundwater may be pumped and blended with groundwater from the deeper aquifer for irrigation and industrial uses (Zikmund 1996).

3.1.2 Site Geology

The geology of the Site consists of interbedded layers and lenses of sand, sandy silt, sandy clay, and silty clay, along with discontinuous zones of caliche and gravel scattered throughout. Lithologic data are available from borehole logs for 46 monitoring wells installed at the Site between 2000 and 2013. The borehole logs and well construction diagrams for all monitoring wells at the Site are in Appendix A.

Additional lithologic information was obtained from 29 soil borings drilled for characterization of source area soils (URS Corporation [URS] 2007b), and from borings installed for active soil-gas sampling within and adjacent to the residential neighborhood (URS 2007d). Depths of monitoring wells at the Site range from 20 to 110 ft, although most wells are completed at depths between 30 and 35 ft.

South-North cross sections west and east of Boulevard Mall (Figures 5 and 6) indicate that the unsaturated zone from 0 to approximately 20 ft bgs consists primarily of sands and silts, but may include soils that consist entirely of sandy clays and clays. The upper 40 ft of the saturated zone (approximately 20 to 60 feet bgs) consist of sands and silty sands, which tend to interbed with lower permeability clays and silts and include lenses of caliche. A unit of predominately fine-grained soil is present from approximately 60 to 90 ft bgs. Below 90 ft bgs is a unit of higher permeability soils (silty sands, sandy silts) with lenses of clay. West-East cross section (Figure 7) oriented parallel to the central line of the PCE plume further illustrates these main units. As indicated by water level measurements in shallow and deep monitoring wells, the bottom of the shallow groundwater system is approximately 60 ft bgs, while the unit below 90 ft bgs belongs to a deeper groundwater system.

East of the Boulevard Mall Property and farther along the plume centerline cross section (Figure 17), sediments along Algonquin Drive consist of gravelly sand and grade into silt with depth to the east (URS 2007d). Within the neighborhood, groundwater is hosted in predominantly silty and clayey layers, with the amount of clay increasing in the eastern portion (Figure 17). Lower permeability clays and silts (silty clay, sandy clay, clayey silt, and sandy silt) dominate the saturated zone of the shallow groundwater system across most of the Site; however, the upper few ft of this zone consists of sands and silty sands within the source area and extending eastward across the Boulevard Mall property, and into the western portion of the neighborhood. This mainly sandy zone may represent portions of a higher permeability paleochannel within the alluvial deposits.

Borehole logs for irrigation wells PW-1 (DWR #5675) and PW-2 (DWR #16296) at the Las Vegas National Golf Course are driller's logs (not geologist logs), and provide less lithological detail. The lithology in PW-1 is described as mainly clay/shale deposits (reddish color) with some sand and gravel "streaks" from 0 to 706 ft, and the main water-bearing gravel layer from 706 to 746 ft bgs. The well seal extends from the ground surface to 130 ft bgs, with a screened interval from about 500 to 746 ft bgs. The lithologic description for PW-2 notes a greater occurrence of caliche zones throughout much of the boring (total depth of 620 ft), but in particular above about 250 ft bgs. Red clay and sandstone are listed as the dominant lithologies on the driller's borelog, along with a screened interval from 220 to 620 ft bgs.

3.1.3 Hydraulic Properties of the Shallow Groundwater System

Depth to groundwater generally ranges between 9 to 28 ft bgs across the Site, but varies annually in each well. Based on water level data obtained in 2013, shallow groundwater flows east with a gradient that ranges from 0.014 to 0.017 ft/foot (Figure 18). Historical groundwater elevations indicate the water table has fluctuated by several feet over the monitoring period from 2000 to 2011, as illustrated on Figure 19. Data for wells adjacent to the golf course show seasonal fluctuations in water levels of approximately 6 ft (Figure 19). However, it is unclear whether these fluctuations represent drawdown or mounding or some degree of both from operation of the golf course irrigation wells.

As discussed in Section 2.2, based on results of pumping tests from two areas on the Boulevard Mall Property, the estimated T and aquifer S for shallow groundwater system range from 64 to 146 ft^2/day and 0.0009 to 0.0017, respectively. Average estimated K values range from 2.1 to 4.2 ft/day. These estimates correspond to previous slug test results (Converse Consultants [Converse] 2004).

Converse conducted slug tests in monitoring wells MW-2, MW-3, MW-13, MW-15, MW-16, MW-19, and MW-20 in 2004 to estimate K values representative of the Site. Calculated K values developed using the Bouwer-Rice Method (Bouwer and Rice 1976) ranged from 1.9 to 17 ft/day, whereas K values calculated using the Hvorslev Method (Hvorslev 1951) ranged from 0.8 to 6.4 ft/day.

As discussed in Section 2.1.2, measured porosity and bulk density in soil samples with varying amounts of coarse and fine-grained soils were 38 to 66 percent and 0.88 to 1.53 g/cm^3, respectively. Converse (2004) obtained similar results from two samples of sandy clay: 49 to 57 percent for porosity and 1.14 to 1.49 g/cm^3 for bulk density. In addition, URS (2007d) conducted bulk density and grain size analyses of soil samples collected from three borings (SVB-5 at depths of 5.5 and 10 ft bgs, SVB-9 at depths of 3 and 8 ft bgs, and SVB-13 at depths of 8.5 and 18.5 ft bgs). Grain size ranged from clayey silt to sandy gravel, and bulk density ranged from 1.6 to 1.91 g/cm^3.

Zikmund (1996) reported results from a study by Western Technologies (1991) to characterize basic hydraulic parameters of the shallow groundwater system in the Valley. Western Technologies tested 2- and 4-inch-diameter wells completed to depths of 25 to 30 ft bgs in downtown Las Vegas. The results of this study (summarized below) show hydraulic characteristics of the shallow groundwater system in the downtown area (near the intersection of U.S. 95 and Interstate 15), approximately 3 miles north-northwest from the former dry cleaners:

- Yield — 0.15 to 8.5 gpm
- Average Transmissivity — 64 ft^2/day
- Horizontal Hydraulic Conductivity — 0.9 to 16 ft/day

Groundwater likely exhibits a range of flow velocities within the generally unconsolidated and heterogeneous geologic deposits that host the shallow groundwater at the Site. Higher rates of flow occur through the coarser grained layers (sands and gravels), and lower rates of flow occur through the finer grained layers (silty sands, silts, and clays). Data from two wells, USGS 43 and USGS 5 (Leising 2004), indicate that shallow groundwater northwest and southeast of the Site may best be characterized as a calcium-magnesium sulfate water, as discussed below in Section 3.14.

3.1.4 Geochemistry of the Shallow Groundwater System

Groundwater in the Las Vegas Wash Aquitard is generally brackish and non-potable. Water quality in the Las Vegas Wash Aquitard generally degrades in an easterly, downgradient direction with increasing concentrations of total dissolved solids (TDS), sulfate, and sodium. Salinity of shallow groundwater is the result of evapotranspiration, dissolution of saline minerals in soils and rocks, and infiltration of irrigation water (Zikmund 1996). Groundwater in the Las Vegas Wash Aquitard in the area of the Site is a calcium-magnesium-sulfate water with a lesser bicarbonate component (Leising 2004). Some parts of the flow system also exhibit elevated concentrations of boron and nitrate (Zikmund 1996). Due to irrigation with chlorinated water from the local water system, chloroform and trihalomethanes may also be present in the shallow groundwater (Leising 2004).

Groundwater samples collected from 12 wells were analyzed for concentrations of major anions (i.e., nitrate, sulfate, chloride, bicarbonate alkalinity), total iron, dissolved manganese, TOC, and dissolved oxygen (URS 2008a). Results are generally consistent with the regional geochemical characterization provided by Leising (2004). Sulfate is the dominant anion, with concentrations ranging from 1,500 to 3,700 milligrams per liter (mg/L) (URS 2008a), with lesser concentrations of bicarbonate and chloride. Nitrate generally ranges from 4.5 to 23.9 mg/L in the shallow groundwater (URS 2008a), and is attributed to the heavy use of fertilizers across the Valley (Leising 2004). TOC in shallow groundwater at the Site ranges from 1.2 to 6.0 mg/L, with one outlier of 24 mg/L having appeared among 49 samples in a data set (URS 2008a).

Field parameters (pH, temperature, specific conductance, turbidity, dissolved oxygen [DO], and oxidation-reduction potential [ORP]) are routinely measured during quarterly groundwater monitoring. TDS concentrations (TDS) range from 900 to 4,300 mg/L in monitoring wells installed across the Site. URS (2008a) reported detectable iron ranging from 1.2 to 38 mg/L and detectable manganese ranging from 0.0053 to 0.69 mg/L; however, turbidity is highly variable and can range from non-detectable to greater than 999 Nephelometric Turbidity Units (NTU) because of abundant silt and clay within the saturated zone. Elevated concentrations of metals reported during prior investigations likely reflect the amount of total suspended solids (i.e., sediment) in the sample. Turbidity measurements are also likely influenced by the effectiveness of well development. Relatively high concentrations of DO averaging 4.1 mg/L and consistently high ORP measurements averaging 188 millivolts indicate oxidizing conditions not conducive to reductive dechlorination of PCE.

Reported ranges and selected summary statistics for the field parameters are listed in Table 3-1.

TABLE 3-1: Statistical Summary of Field Parameters

	pH	Temp (°C)	SC (mS/cm)	Turbidity (NTU)	DO (mg/L)	TDS (g/L)	ORP (mV)
Arithmetic Mean	6.66	24.5	4.03	153	4.11	2.5	188

3.2 Nature and Extent of Contamination in Shallow Groundwater

The Maryland Square PCE plume extends at least 6,000 ft eastward from the former Maryland Square Shopping Center that hosted the former dry cleaners, beneath the Boulevard Mall and a residential neighborhood, past the Las Vegas National Golf Course, and across S. Eastern Avenue (Figure 3) for at least another 1,500 feet (based on the 5 µg/L contour). For the first 2,000 feet from the source, the plume is about 500 feet wide. However, about midway through the residential neighborhood, probably because of golf course irrigation, the PCE plume broadens, widening along its northern edge to become about 1,000 feet wide by the time the plume reaches the western edge of the golf course. (Figure 3).

Delineation of the vertical extent of the plume was performed during implementation of Phases I and II of the work described in this CAR. As discussed in Section 2.1.1, based on vertical delineation results for two areas at the Boulevard Mall Property, PCE contamination is limited to the shallow groundwater system and is likely absent below 81 ft bgs.

The investigation of groundwater began in August 2000, with a limited Phase II Environmental Site Assessment at the former Maryland Square Shopping Center, where the former dry cleaners operated from 1969 to 2000 (Converse 2000). Following discovery of PCE in groundwater at the Property, an off-site investigation began to delineate the extent of the PCE plume, with installation of five wells downgradient of the property (Converse 2002). Since that time, additional wells have been installed across the site in a phased approach to further define the plume (see http://ndep.nv.gov/pce/graphic/2012_Map_Well_History.pdf). Quarterly scheduled monitoring and sampling of groundwater has been performed since May 2005. Currently, 46 monitoring wells are installed at the Site, and are part of the monitoring program (Figure 3). Eleven wells within the residential area of the plume are sampled quarterly. Eleven wells within the area of the former dry cleaners, the Boulevard Mall, and the southwestern residential area are sampled semi-annually. All wells in the program are sampled during the 4th quarter monitoring event, and water-level measurements are obtained quarterly.

Assuming the PCE releases began in 1969 at the former dry cleaners, and that the leading edge of the dissolved PCE plume traveled 6,000 feet in that time, the estimated average velocity of PCE migration is 140 ft/year. PCE was first reported in a sample collected from golf course irrigation well PW-1 at 8.1 µg/L in 1990. Therefore, the plume likely arrived at PW-1 after 18 to 20 years of migration.

The plume would have initially migrated from the source area preferentially through the fine sands and gravels because of their higher hydraulic conductivity. Assuming a gradient of 0.0155 ft/foot, an average hydraulic conductivity of 10 ft/day, and a porosity of 0.25 (effective porosity of sand), the average shallow groundwater flow velocity through this material is approximately 230 ft/year. If the PCE plume moved slower at 140 ft/year, it was apparently retarded by a factor of 1.6, which is expected when PCE is minimally degraded and migrates through an environment with low organic carbon content (supported by low TOC data):

$$v = \frac{K * t}{n} \left(\frac{dh}{dl} \right)$$

$$v\ (ft/yr) = \frac{10\ (ft/day) \times 365\ (days/yr)}{0.25} \times 0.0155\ (ft/ft)$$

$$v = 226.3\ ft/yr$$

$$R_f = \frac{velocity\ of\ water}{velocity\ of\ contaminant}$$

$$R_f = \frac{226}{140} = 1.6$$

where:
K = hydraulic conductivity (ft/day)
dh/dl = hydraulic gradient (ft/ft)
n = effective porosity
t = time (days)
R_f = retardation factor

Note that the estimated groundwater flow velocity represents flow through the most permeable zones averaged over the entire length of the plume. The groundwater flow velocity at any given point in the plume may vary and could be much lower in fine-grained soils such as those found at the Boulevard Mall property (see Section 2.2.3).

Analytical data for PCE daughter products indicate limited, if any, degradation of PCE at the Site. Low levels of TCE and *cis*-1,2-dichloroethene (DCE) have been detected in wells MW-2, MW-5, and MW-6 (concentrations of about 0.5% of the PCE concentration). This is roughly the percentage that TCE occurs as a trace contaminant in industrial grade PCE. The highest concentrations of daughter products have been detected in samples from MW-6 (maximum TCE concentration of 41 µg/L and maximum *cis*-1,2-DCE concentration of 23 µg/L). This indicates that natural attenuation of PCE through reductive dechlorination is not prevalent at the site.

Based on the PCE plume geometry shown on Figure 3, an average total porosity of 0.41, and an average saturated thickness of 35 feet, the volume of contaminated groundwater is estimated at 198 million gallons within the 276 µg/L contour, and 317 million gallons within the 9.7 µg/L contour. The estimated dissolved mass of PCE within the 276 µg/L contour is 1,033 pounds (lbs), and the estimated dissolved mass of PCE within the 9.7 µg/L contour is 1,359 lbs. Based on an average organic carbon content of 0.065 percent, and an organic carbon-water partition coefficient of 265 liters per kilogram, mass of PCE adsorbed to soil is estimated at 684 lbs within the 276 µg/L contour and 900 lbs within the 9.7 µg/L contour. The total dissolved and sorbed mass of PCE in the saturated zone is estimated at 1,717 lbs within the 276 µg/L contour and 2,259 lbs within the 9.7 µg/L contour. This equates to 127 gallons and 167 gallons of PCE respectively. The quantity of nonaqueous-phase PCE that may be smeared to soil in the saturated zone cannot be estimated.

4.0 SCREENING LEVEL HUMAN HEALTH RISK ASSESSMENT

The primary objective of the SLHHRA is to determine whether site contaminants pose a current or potential risk to human health in the absence of remediation. The SLHHRA helps to evaluate whether further remediation is necessary at the site. The complete SLHHRA is provided in Appendix F.

Tetra Tech conducted the SLHHRA at the Site consistent with EPA and state guidance. As described in *Risk Assessment Guidance for Superfund* (RAGS) (EPA 1989), the risk assessment is conducted in four basic steps: (1) data evaluation and identification of contaminants of potential concern (COPC), (2) exposure assessment, (3) toxicity assessment, and (4) risk and hazard characterization. In addition, the SLHHRA includes a discussion and evaluation of significant sources of uncertainties in the risk assessment process as applied at the Site.

The SLHHRA is based on the data from indoor air samples collected at houses in the Paradise Palms neighborhood. All detected chemicals in the indoor air samples were selected as COPCs. Thus, the COPCs evaluated in this SLHHRA are PCE, TCE, and vinyl chloride. All properties were evaluated and sorted into one of eight different groups depending on property location, availability of indoor air sample data, and analytical data from sampling (see Appendix F, Table 2).

4.1 Results of the Vapor Intrusion Risk Evaluation

Health risks posed by exposure to vapor intrusion (VI) were estimated quantitatively at 45 houses. Forty-two houses above the 100 µg/L groundwater PCE plume contour with detected sampling results and that do not have SSD systems were included in the quantitative assessment. Three houses with detected results and that are not within the 100 µg/L groundwater PCE plume contour were also evaluated quantitatively. Sampling was offered to any homeowner whose property lay partially or wholly within the 100 µg/L contour; however, thirty-three houses within the VI area of concern have not undergone any air sampling. These 33 properties are evaluated qualitatively.

4.1.1 Estimated Cancer Risks

Table 4-1 presents cancer risk estimates for the 45 houses included in the quantitative risk assessment. None of the houses in the quantitative evaluation had an estimated potential incremental cancer risk exceeding the 1 in 10,000 (1E-04) action level. The highest estimated potential cancer risk was 5E-06. This estimated risk occurred at Broadbent identification (ID) 985. This house was not sampled by Tetra Tech in 2012 (ID 1626). The measured indoor air concentration of PCE at this house was 43 µg/m^3, which exceeds the interim action level of 32 µg/m^3 established by NDEP. This house is eligible to have a SSD system installed; however, the homeowner refused the installation.

As shown on Table 4-1, 22 houses had estimated potential incremental cancer risk within the risk management range of 1 in one million (1E-06) to 1E-04). Of the 22 homes, nine had risks equivalent to the low end of the risk management range at 1E-06.

The houses with estimated risks within the risk management range are primarily on Seneca Lane or Maricopa Way. Two of the houses in the risk range are on Ottawa Drive, and two are on Cherokee Lane. One of the houses is at the eastern edge of the VI area of concern on Ottawa Circle. Two of the houses outside the 100 µg/L groundwater PCE contour had estimated cancer risks within the risk management range.

Twenty-three houses included in the quantitative assessment had estimated potential cancer risks of less than 1E-06. These houses are considered to have negligible cancer risk from VI to indoor air.

4.1.2 Estimated Noncancer Hazards

Table 4-1 presents noncancer hazard estimates for the 45 houses included in the quantitative risk assessment. No houses had an estimated noncancer hazard greater than the action level of 1. One house had an estimated noncancer hazard equal to 1. This estimated noncancer hazard occurred at Broadbent ID 985. This house was not sampled by Tetra Tech in 2012 (ID 1626). The measured indoor air concentration of PCE at this house was 43 µg/m^3, which exceeds the interim action level of 32 µg/m^3 established by NDEP. This house is eligible to have a SSD system installed; however, the homeowner refused the installation.

All of the other houses in the VI area of concern have an estimated noncancer hazard less than 1, and are thus below a level of concern for non-cancer hazards from VI to indoor air.

4.1.3 Qualitative Assessment of Houses without Indoor Air Sample Results

Thirty-three parcels within the VI area of concern have been offered indoor air sampling, but to date, have not been sampled. Assuming the highest detected concentrations would have been found in the houses not having undergone indoor air sampling, the estimated potential incremental cancer risk would be 3E-05, and the estimated non-cancer hazard would be 7 (Table 4-1). This estimated potential cancer risk is within the cancer risk range of 1E-06 to 1E-04, while the estimated non-cancer hazard exceeds the HI=1 threshold.

The uncertainty level associated with assigning indoor air concentrations from three houses to other houses is very high. Use of these indoor air concentrations assumes that the subsurface conditions and building properties that resulted in the indoor air concentrations observed in the sampled houses applies to the houses that have not been sampled. In addition, samples collected from other houses in the area have confirmed that the distribution of PCE concentrations in indoor air does not correlate to the distribution of PCE concentrations in groundwater. Indoor air concentrations above a level of concern are possible in any of the houses above the plume because of the possibility of preferential vapor pathways such as utility conduits, or individual building properties such poor foundation condition or ventilation properties of the house. Indoor air sampling is necessary to quantitatively assess the risk at any individual property above the plume.

4.2 Uncertainty Assessment

The risks and hazards calculated as part of the Site SLHHRA are subject to various degrees of uncertainty from a variety of sources associated with all the major phases of the human health risk assessment (HHRA) process. The uncertainty assessment identifies and discusses the nature of the uncertainty associated with the most significant sources of site-specific uncertainty.

It should be noted that human health implications related to PCE, or any other type of contaminant exposure, are not entirely based on the concentration and time period of exposure, but individual differences among the exposed population also play a role in the human health response. Individual traits including, but not limited to, differences in age, sex, diet, health status, family history of disease, and personal lifestyle choices can impact individual sensitivity to exposure and the severity of response.

Virtually every step in the HHRA process requires numerous assumptions, all of which contribute to uncertainty in the risk evaluation. In the absence of empirical or site-specific data, assumptions are

developed based on best estimates of data quality, exposure parameters, and dose-response relationships. Overall, conservative measures were used to address the uncertainties in the SLHHRA; thus, the SLHHRA is expected to overestimate actual risks to receptors in the VI area of concern.

4.3 Summary and Conclusions of the SLHHRA

None of the houses included in the quantitative evaluation had an estimated potential cancer risk exceeding the 1E-04 action level. Twenty-two of the 45 houses evaluated had estimated potential cancer risk within the risk management range (1E-06 to 1E-04); however, none the estimated risks exceeded 5E-06, and nine houses were equivalent to the low end of the range at 1E-06. Twenty-three houses had estimated potential cancer risks of less than 1E-06. These houses are considered to have negligible cancer risk from VI to indoor air.

None of the houses included in the quantitative evaluation had an estimated noncancer hazard greater than the action level of 1. One house had an HI equal to 1. All of the other houses in the VI area of concern have an estimated noncancer hazard less than 1, and thus are below a level of concern for non-cancer hazards from VI to indoor air.

One house had an estimated cancer hazard equal to 5E-06 and a noncancer hazard equal to 1. This estimated cancer risk and noncancer hazard occurred at Broadbent ID 985. This house was not sampled by Tetra Tech in 2012 (ID 1626). The measured indoor air concentration for PCE at this house was 43 µg/m^3, which exceeds the interim action level of 32 µg/m^3 established by NDEP. This house is eligible to have an SSD system installed; however, the homeowner refused the installation. Installation of an SSD system would reduce the potential cancer risk and noncancer hazard estimated for this house below a level of concern.

Indoor air sampling data are not available for 33 parcels wholly or partially within the 100 µg/L contour groundwater PCE contour. Assuming the highest detected concentrations would have been found in these houses, the estimated cancer risk would be 3E-05, which is within the cancer risk range of 1E-06 to 1E-04, while the estimated non-cancer hazard of 7 would exceed the HI=1 threshold. The uncertainty level associated with assigning indoor air concentrations from three houses to other houses is very high. Indoor air sampling is necessary to quantitatively assess the risk at any individual property above the plume.

The largest sources of uncertainty in the risk assessment are (1) use of a single sample result for estimating risk and (2) lack of sampling data regarding potential temporal variations in the PCE concentrations in indoor air in the houses.

TCE - Trichloroethene

5.0 CORRECTIVE ACTION OBJECTIVES AND REMEDIATION GOALS

The preliminary CAOs and numerical remediation goals were established in the GW CAP to address site-specific COPCs, affected media, and potential exposure pathways, and to guide evaluation of potential corrective actions. These preliminary CAOs and remediation goals have been refined and updated based on (1) data obtained since the GW CAP and the IA/WW Work Plan were written and (2) results of the SLHHRA. The following sections present the proposed CAOs and remediation goals for the Site. CAOs and numerical remediation goals become final when the corrective action is selected in the Record of Decision for the Site.

5.1 Corrective Action Objectives

The following CAOs, developed in the GW CAP, address potential risks to human health and the environment, and are consistent with NAC and Adopted Regulation R189-08:

- Protect human health by reducing inhalation exposure to PCE and daughter products emanating from groundwater containing PCE concentrations above the remediation goals.
- Remediate shallow groundwater where PCE concentrations exceed the remediation goal for groundwater to protect indoor air.

Groundwater at the site is not a source of drinking water due to poor water quality; however, groundwater is considered "waters of the state," and regulations require "no degradation" of waters of the state. State records show that domestic water supply wells exist east of Eastern Avenue, more than 6,300 feet from the source area, and some of these wells are screened as shallow as 30 ft bgs (NDEP 2012a). Details on identified domestic water supply wells are included in the UIC permit (Appendix E). While domestic water supply wells at the Site are not permitted by the Department of Conservation and Natural Resources, Division of Water Resource, some residents or businesses may continue to pump and use shallow groundwater without regulatory or municipal authorization (existing wells are to be abandoned when the business or residence is connected to the municipal water supply). The GW CAP, in conjunction with the IA/WW Work Plan, determined that domestic wells within the described plume boundaries should be identified. Therefore, an additional CAO applies:

- Execute appropriate action to ensure PCE does not exceed risk-based standards in domestic water supply wells.

5.2 Remediation Goals for Groundwater and Indoor Air to Protect Against Vapor Intrusion

PCE is the primary contaminant of concern (COC) at the Site. Two daughter products of PCE, TCE and vinyl chloride, have also been detected in a few indoor air samples collected from houses within the residential area. The PCE daughter product *cis*-1,2-DCE has not been detected in indoor air, but has been detected at low levels in some groundwater samples. However, because no toxicity values have been established for *cis*-1,2-DCE, a remediation goal cannot be calculated. Volatilization of contaminants from the groundwater and subsequent transport of these vapors into indoor spaces represent a potentially complete exposure pathway via inhalation of contaminated indoor air.

As detailed in the GW CAP, development of numerical remediation goals are based on calculation of risk-based concentrations. The preliminary methodology for development of the remediation goals was summarized in the IA/WW Work Plan, approved by NDEP on August 23, 2011 (Tetra Tech 2011b).

An increased incidence of cancer less than 1 in one million (1E-06) and a noncancer HI less than 1 are considered protective for long-term exposure to contaminants. These values are also considered the point-of-departure dictating corrective action, and are the RSLs. Calculation of risk-based concentrations in groundwater protective of indoor air concentrations at a target cancer risk of 1E-06 and noncancer HI of 1 are necessary to establish the remediation goals for groundwater at the Site.

Calculated remediation goals for groundwater COCs to protect residential indoor air are listed in Table 5-1, and Figure 20 shows the area where these remediation goals are applicable, east of the Boulevard Mall eastern parking lot and west of Eastern Avenue. The primary remediation goals for groundwater at the Site are based on potential for VI into houses above the plume of contaminated groundwater. Thus, risk-based groundwater concentrations protective of indoor air concentrations were calculated. The remediation goal requires determination of the contaminant concentrations in groundwater that result in indoor air concentrations from VI below a level of concern considering conditions at the site. The EPA version of the Johnson and Ettinger (J&E) Model (1991) can estimate risk-based concentrations of COCs in groundwater based on user-defined target cancer risks and non-cancer hazard quotients of those contaminants. The EPA version of the J&E model (GW-ADV-Feb04, Version 3.1 [EPA 2004]) was used to calculate remediation goals for the shallow groundwater underlying the residential area east of the Boulevard Mall and west of Eastern Avenue. Inputs to the J&E Model include chemical properties of the contaminant, properties of saturated and unsaturated soils, and functional properties of the building. Current EPA chemical-specific properties and toxicity values (EPA 2012) for the COPCs were used in the model. Site-specific parameters (e.g., soil type, average depth to groundwater, average groundwater temperature) were used if available; otherwise, conservative default parameters were used. Information from the soil boring for monitoring well MW-18 (Figure 1) was used as the basis for site-specific soil type, average depth to groundwater, and average groundwater temperature. This well was selected because, historically, it has shown the highest PCE concentrations in groundwater underlying the residential area, as well as the shallowest depth to groundwater in the residential area. Further discussion of the model assumptions, inputs, and uncertainty and sensitivity appears in Appendix G.

An indoor air remediation goal for PCE of 42 $\mu g/m^3$ will be used to verify that the groundwater remediation goal is protective of the VI to indoor pathway. This remediation goal is based on a noncancer HI of 1. The indoor air remediation goal applies to houses between the eastern parking lot of Boulevard Mall and Eastern Avenue.

TABLE 5-1: Remediation Goals to Protect Residential Indoor Air

TCE	Trichloroethene

5.3 Remediation Goals for Groundwater To Protect Downgradient Domestic Wells

State records show that domestic wells may exist east of Eastern Avenue. There is potential for some domestic wells to be in hydraulic communication with contaminated shallow groundwater, but there is currently no eveidence of such. MW-38 is the only monitoring well east of Easter Avenue and there is some uncertainty in the boundary of the PCE plume in this area. There are plans to install additional groundwater monitoring wells here by August 31, 2013, and groundwater monitoring will continue to track changes in plume nature and extent. Thus, to protect against future ingestion of PCE-contaminated groundwater east of Eastern Avenue, a risk-based remediation goal for PCE was established for this area. The risk-based remediation goal of 9.7 µg/L of PCE in groundwater was determined based on an increased incidence of cancer less than 1E-06 and a noncancer HI less than 1. This remediation goal is considered protective for long-term exposure to PCE in drinking water. In addition, the MCLs for TCE and vinyl chloride are included as remediation goals. MCLs are enforceable standards and were included as the remediation goals for TCE and vinyl chloride because risk-based goals for TCE and vinyl chloride are lower than their MCLs and considered unattainable due to the limitations of best available technologies. Table 5-2 presents the remediation goals for groundwater considered protective of domestic water supply wells, and Figure 20 shows the area where these remediation goals are applicable, east of Eastern Avenue.

TABLE 5-2: Remediation Goals to Protect Domestic Wells

6.0 EVALUATION OF CORRECTIVE ACTION ALTERNATIVES

This section summarizes recommendations from the GW CAP (Tetra Tech 2011a) and the process that led to selection of the preferred corrective action alternative.

The GW CAP (Tetra Tech 2011a) evaluated corrective action alternatives for overall protection of human health according to criteria of long-term and short-term effectiveness; reduction in toxicity, mobility, and volume through treatment; implementability; and cost. The outcome of the analysis was uncertain, and the GW CAP recommended additional vertical delineation of groundwater contamination, aquifer testing, bench-scale testing, and pilot testing before selection of a corrective action alternative. Groundwater extraction, ISCO using permanganate, ISCO using ozone and hydrogen peroxide, and AS were selected for pilot testing. The GW CAP further recommended that if these technologies would prove insufficient or problematic during field testing, corrective actions integrating remedial effects of extraction and treatment should be further evaluated. The GW CAP summarized the advantages and disadvantages of each technology as well as questions to be answered with the aquifer and pilot testing (Table 8.2 of the GW CAP; this table has been updated and can be found in Table 6-1).

Groundwater extraction (pump and treat) was evaluated for site-wide use through aquifer pumping tests conducted in July 2012. Overall low pumping rates were observed. The pumping rate on the eastern side of Boulevard Mall was 1 gpm, and little drawdown was observed in observation wells. Testing on the western side of the Boulevard Mall could have sustained a slightly higher pumping rate of 1.5 to 2 gpm. Wells screened in the shallow water-bearing zone would produce water at very low flow rates making them impractical for use in groundwater extraction. Given the low pumping rates and the associated small capture zones, groundwater extraction for hydraulic control or PCE mass removal would be challenging within the Boulevard Mall property. The feasibility of groundwater extraction outside the Mall property was not evaluated and may be considered at a later date, if necessary.

The AS pilot test was eliminated after subsurface investigations within the pilot testing area revealed layers of caliche and other fine-grained soils below the lowest observed water table. Caliche layers and clayey lenses are undesirable for AS with SVE. Caliche and clayey lenses limit vertical distribution of air through the aquifer, reducing remedial effectiveness. The low-permeability layers also hinder recovery of sparged air containing stripped contaminants. A variant of AS/SVE, consisting of AS with dual-phase extraction (DPE) was evaluated for use at the source area and the western side of Boulevard Mall. The lithology in these areas was considered more favorable to AS, and DPE could draw down groundwater below the caliche layer and allow recovery of sparged air. However, pumping tests suggested inadequate recovery rates and narrow cones of depression, rendering AS with DPE infeasible.

Pilot testing results show that both ISCO using permanganate and ISCO using ozone and hydrogen peroxide achieve significant destruction of PCE in groundwater. Both technologies could be used at this site and are therefore retained for development of the recommended corrective action.

TABLE 6-1: Summary of Technology Data Needs and Findings

Technology	Current Data	Data Acquired and Technology Evaluation
In Situ Chemical Oxidation	• Tetrachloroethene (PCE) concentrations in groundwater (concentrations are within the treatment range of in situ chemical oxidation). *In situ chemical oxidation proved effective at reducing PCE concentrations at the pilot test site.* • Metals concentrations in soil and groundwater (concentrations are low enough that metals mobility should not be an issue, but additional testing required). *Chromium concentrations in groundwater increased during the testing period but decreased after testing was complete.* • Lithologic logging, soil type, and groundwater velocity (current boreholes in target area, however, more contiguous vertical delineation is needed). *The bottom of PCE contamination was found at approximately 60 feet (ft) below ground surface (bgs). A competent clay layer was also found at approximately 60 to 65 ft bgs. On the Boulevard Mall property treatment should focus from the top of the water table to 60 to 65 ft bgs.*	• Aquifer pump tests. *Pumping rates observed during the pump tests were low; however injection rates, pressure and radius of influence (ROI) were favorable as measured during the In-situ chemical oxidation (ISCO) pilot testing.* • Vertical delineation of lithology and PCE distribution in target areas. *Vertical delineation provided the distribution of contaminants from the top of the water table to the approximately 60 feet bgs. Injection can be tailored based on depth and contaminant concentration.* • Bench scale testing including natural oxidant demand (NOD), dosing requirements, optimal activator, and metals mobility testing. *Results of the bench scale test indicated fairly low NOD, which is favorable to ISCO treatment. Significant mobilization of metals was not observed during bench scale testing.* • Geotechnical testing to determine porosity, grain size distribution, soil type. *Results can be found in Table 2.1.2. Based on the ROI and decreases in PCE concentrations, ISCO conducted in areas with these soil types will be effective.* • Pilot testing for effectiveness, ROI, preferential pathways, injection method. *ISCO with potassium permanganate and hydrogen peroxide and ozone successfully treated PCE during the pilot test. A ROI of 25 ft was observed up to 60 ft bgs during potassium permanganate injection. A ROI of 8 to 15 ft was observed during the hydrogen peroxide/ozone injection (PulseOx).*
Air Sparging (AS)	• PCE concentrations in groundwater (concentrations are within the treatment range of sparging). *The pilot test was not conducted due to subsurface conditions.* • Lithologic logging (current boreholes in target area, however, more contiguous vertical delineation is needed). *Given the lithology (a competent layer of caliche below the water table) AS was not a viable treatment option.*	• Aquifer pump tests. *AS with dual-phase extraction (DPE) was evaluated for use at the source area and the western side of Boulevard Mall. However, pumping tests suggested inadequate recovery rates and drawdown, rendering AS with DPE infeasible.* • Vertical delineation of lithology and PCE distribution in target areas. *Given the lithology (a competent layer of caliche below the water table) AS was not a viable treatment option.* • Geotechnical testing to determine porosity, grain size distribution, and soil type. *The pilot test was not conducted due to subsurface conditions* .

Technology	Current Data	Data Acquired and Technology Evaluation
		• Pilot testing for effectiveness, ROI, air permeability, flow rates, and vapor capture. *The pilot test was not conducted due to subsurface conditions.*
Extraction and Treatment,	• PCE concentrations in groundwater (concentrations are within the treatment range of chemical reduction). *Not evaluated.* • Total dissolved solids data (elevated concentrations may make system operation challenging). *Not evaluated.* • Lithologic logging (current boreholes in target area, however, more contiguous vertical delineation is needed). *The bottom of PCE contamination was found at approximately 60 ft bgs. A competent clay layer was also found at approximately 60 to 65 ft bgs.*	• Aquifer pump tests. *Wells screened in the shallow water-bearing zone would produce water at very low flow rates making them impractical for use in groundwater extraction.* • Vertical delineation of lithology and PCE distribution in target areas. *Moderate permeability soils are likely present in the subsurface as thin disconnected lenses which would not support significant well yields.* • Geotechnical testing to determine porosity, grain size distribution, and soil type. *Results can be found in Table 2.1.2. Based on the low pumping rates, groundwater extraction conducted in areas with these soil types will not be effective* • Pilot testing for ROI and treatability of groundwater. *Given the low pumping rates and small radii of influence, groundwater extraction for hydraulic control or PCE mass removal would be challenging within the Boulevard Mall property.*

Notes:

Originally Table 8.2 of the Corrective Action Plan for Groundwater (Tetra Tech 2011a).

Updated text based on data collected during the aquifer and pilot tests is italicized.

7.0 Recommended Corrective Action

ISCO is recommended for treatment of PCE in groundwater. ISCO will be implemented using one or more of the following chemicals: sodium or potassium permanganate, ozone, and/or hydrogen peroxide.

ISCO will target accessible areas where PCE concentrations in groundwater exceed the remediation goal for protection of indoor air. The general remedial approach is to deplete the source and clean up shallow groundwater within the compliance areas to the extent practicable. Shallow groundwater is defined as groundwater within the shallow water bearing zone overlying the clay formation encountered at 60 to 65 ft bgs. The compliance areas are shown on Figure 20.

The PCE source will be depleted by:

- Implementing ISCO within the source area west of Maryland Parkway, with the zone of oxidation extending below Maryland Parkway.
- Implementing ISCO within accessible portions of the Boulevard Mall property west of the Mall building, with the zone of oxidation extending below the Mall building.

Source depletion will have been achieved when potential is lacking for discharge of COCs to compliance areas at concentrations above remediation goals.

Shallow groundwater within the compliance areas will be remediated by:

- Implementing ISCO on the Boulevard Mall property east of the Mall building to cut off the PCE plume at the property boundary.
- Implementing ISCO within accessible portions of the residential area east of the Boulevard Mall to expedite attainment of remediation goals, as necessary.

Domestic water supply wells east of Eastern Avenue will be protected by:

- Identifying domestic water supply wells contaminated with PCE.
- Abandoning contaminated wells or providing point of entry treatment.

7.1 Safety Measures

Oxidants would be stored and handled in accordance with Clark County regulations. Secondary containment would be provided for all chemicals. If solid oxidant is brought to the site, the oxidant would be stored and handled in a manner that minimizes dust generation. Liquid oxidant injection would be designed to minimize potential for surfacing, and if surfacing occurs, the surfaced liquid would be cleaned up promptly.

If ISCO involves ozone injection:

- Continuous ambient ozone monitors would be used to ensure compliance with Nevada ambient air quality standards. The ozone injection system would automatically shut down if the ozone ambient air quality standard is exceeded. The number and location of ozone monitors would be determined in consultation with NDEP.

- Sentinel vapor monitoring wells screened in the vadose zone may be installed between ozone injection wells and living spaces. Need for such wells depends on locations of injection wells and their proximities to living spaces. Therefore, details of ozone monitoring in soil vapor would be determined in consultation with NDEP.

- If ozone in soil vapor is a threat to indoor air quality, system operation would be modified or SVE would be implemented. Off-gas from SVE would be treated in accordance with Nevada regulations.

- Sparging without ozone for longer than 24 hours would require SVE and off-gas treatment.

7.2 Performance Monitoring

Performance monitoring will seek to optimize corrective action and will depend on the means and methods of corrective action. Therefore, the number and locations of monitoring wells, monitoring frequency, and monitoring parameters will be detailed during remedial design. Monitoring parameters will include COCs, anions, geochemical field parameters, and dissolved oxidant concentrations.

7.3 Compliance Monitoring

The purpose of compliance monitoring will be to evaluate progress toward attainment of remediation goals within the compliance areas. Compliance wells are monitoring wells within the compliance areas where a COC has been detected above its remediation goal during any of the last four monitoring events. Currently, those wells are: MW-18, MW-23, MW-25, MW-26, MW-27, MW-32, MW-38, and MW-39. Any monitoring well within the compliance areas at which a COC is detected (in the future) above its remediation goal will also become a compliance well. A compliance well no longer useful will be removed from the program upon NDEP approval.

Monitoring parameters will include COCs, dissolved metals, anions, and geochemical field parameters. Metals are included because manganese may be introduced if ISCO involves permanganate injection, and naturally occurring metals (such as chromium) may temporarily become more soluble during ISCO. Because these temporary effects will naturally reverse after ISCO stops, metals will require no action other than monitoring. Metals monitoring will also comply with the conditions of the UIC permit to be obtained for ISCO.

If permanganate-based ISCO is used, dissolved sodium or potassium permanganate may also be monitored. After corrective action starts, compliance wells will be monitored quarterly for 2 years, semi-annually for 2 years, and annually thereafter. Monitoring frequency at a well will not be decreased if concentration of a COC trends upward in that well. Similarly, if concentration of a COC trends upward during annual or semi-annual monitoring, monitoring frequency will be doubled.

Indoor air will be monitored as approved by the NDEP under the existing program, and the properties to be monitored will be determined in consultation with the NDEP.

7.4 Domestic Water Supply Wells

There are wells east of Eastern Avenue being used for domestic water supply. However, additional, undocumented domestic water supply wells may exist. The documented domestic water supply wells appear to be located outside the estimated boundary of the 9.7 µg/L PCE plume (Appendix E). The locations of undocumented wells are unknown. After the 9.7 µg/L PCE plume has been fully delineated,

domestic water supply wells within the plume will be identified in accordance with the IA/WW Work Plan (Tetra Tech 2011b). These wells will be sampled, if possible, and the samples will be analyzed for COCs. If any COC is detected above its remediation goal, a mitigation plan will be developed. In the absence of a better alternative, wells contaminated with PCE above 9.7 µg/L will be abandoned if permitted by the well owners.

7.5 Monitored Natural Attenuation

Monitored natural attenuation (MNA) is not an anticipated component of this corrective action. However, MNA will be evaluated as an alternative if progress with ISCO becomes asymptotic and accelerating progress through other means is deemed impractical. If MNA is found feasible, the corrective action would transition to MNA after approval by the NDEP.

7.6 Confirmation of Cleanup

Quarterly monitoring will resume when cleanup must be confirmed. Cleanup will have been achieved when COC concentrations in groundwater and indoor air remain below their remediation goals for four consecutive monitoring events after ISCO stops. Assumedly, ISCO will stop when ozone injection stops, or when the concentration of sodium or potassium permanganate in compliance wells has been below 1 mg/L for 1 year. Because ozone lasts only a few hours in the dissolved phase, COC destruction would stop almost as soon as ozone injection stops. Permanganate, on the other hand, can persist for several months, but 1 year after its concentration declines below 1 mg/L (as sodium or potassium permanganate), COC destruction, if any, would be insignificant.

7.7 Deep Groundwater Protection

A video survey of irrigation well PW-1 at the Las Vegas National Golf Club revealed damage to the well casing. In its present condition, this well acts as a conduit for contamination of deep groundwater. Therefore, the well owner will be required to repair this well, or plug and abandon it in accordance with NAC 534.427, so that it no longer threatens groundwater quality.

7.8 Interim Protection of Indoor Air

SSD systems are operating in 14 homes, and will soon be installed in 3 more homes within the compliance area. SSD systems minimize soil VI and the consequent migration of COCs into indoor air. Homes in the indoor air monitoring program will continue to be monitored annually. Owners/residents of homes within the compliance area and not being monitored will continue to be offered the option of annual indoor air monitoring. New SSD systems would be installed in homes when indoor air monitoring results indicate these are needed. An SSD system will operate until groundwater underlying the home has attained remediation goals, or changes to the home or site conditions render the SSD system unnecessary.

7.9 Access and Permitting

Implementing the recommended corrective action will require access to private properties, including the Boulevard Mall, the former dry cleaners, residences, businesses, and the Ruby S Thompson Elementary School. An access agreement will be necessary for any work performed on the Boulevard Mall property. Similarly, other businesses, homeowners, and commercial property owners may also require access agreements.

A UIC permit will be obtained from NDEP Bureau of Water Pollution Control before injection of any chemicals into groundwater. Permitting conditions are likely to include monitoring for dissolved metals to ensure that ISCO does not impair groundwater quality. The intent of such monitoring would be to demonstrate that increases in concentrations of dissolved metals are both localized and temporary. Compliance with this anticipated permitting condition is discussed in Section 7.3.

Construction permits and hazardous materials storage permits will be obtained from Clark County before conducting any of these permitted activities.

1.0 INTRODUCTION

Tetra Tech EM Inc. (Tetra Tech) conducted aquifer testing at the Maryland Square Tetrachloroethene (PCE) Site (the Site) located approximately 2 miles east of downtown Las Vegas, Nevada (Figure 1). Purposes of aquifer testing were to estimate the hydraulic properties (e.g., hydraulic conductivity, transmissivity, and storage coefficient) of geologic materials at the site, and to obtain additional information on site hydrogeology.

1.1 SITE DESCRIPTION AND BACKGROUND

The Site contains a dissolved PCE plume that extends east (downgradient) from the location of the former dry cleaners (Al Philips the Cleaner), in the former Maryland Square Shopping Center (the Property) at 3661 South Maryland Parkway. The former dry cleaners operated in the former Maryland Square Shopping Center from 1969 to 2000. The former dry cleaners is on the west side of South Maryland Parkway, approximately 400 feet (ft) north of Twain Avenue, across the street from The Boulevard Mall (Figure 1). The exact date of the release (or releases) from the dry cleaners is unknown, although one 100-gallon spill was documented to have happened in 1982.

The historical discharge of PCE at the former dry cleaners facility was discovered during a due diligence environmental site assessment (Nevada Division of Environmental Protection [NDEP] 2012), and was reported on November 29, 2000, via the NDEP spill reporting hotline. In June 2005, the former shopping center, including the dry cleaning facility, was demolished.

A series of environmental investigations occurred on and off the Property from 2000 to present. Investigations on the Property determined the extent of PCE-contaminated soil. Investigations on and off the Property determined the extent of PCE-contaminated groundwater. Additional information on the history of the Site, as well as a list of previous investigations, appears in the GW CAP (Tetra Tech 2011a). In addition, the administrative record for the Site is available on-line at NDEP's website: http://ndep.nv.gov/pce/foia.htm. PCE-contaminated soil was removed from the Property in the summer of 2011.

This PCE plume in shallow groundwater extends downgradient of the former dry cleaning facility, beneath the Boulevard Mall, residential properties, and a golf course, past Eastern Avenue, which is approximately 6,000 ft downgradient. The western third of the plume is shown on Figure 1.

1.2 PHYSICAL SETTING AND SITE HYDROGEOLOGY

The Site is in the east-central portion of the Las Vegas Valley. Precipitation on the Valley floor averages 4.16 inches per year as reported by the Western Region Climate Center (WRCC 2010). Most precipitation occurs during the months of July and August

and during the winter (Wild 1990). Potential evapotranspiration ranges from 1 to 19 inches per month from winter to summer months (Shevenell 1996).

The Las Vegas Valley is a structural basin within the Basin and Range Province of the northern Mojave Desert (Langenheim and others 1998). The Valley is filled with 3,000 to 15,000 feet of sediments and, in the east central valley area, coarser-grained deposits interfinger with layers and lenses of sandy silt, silty sand, clayey sand, sandy clay, and caliche (Plume 1989, Leising 2004). Coarser grained deposits generally serve as aquifers, whereas the silts, clays, and caliche generally act as confining layers (Zikmund 1996). The upper unit of heterogeneous sand, silt, and clay sediments is termed the Las Vegas Wash Aquitard. Based on well logs on file with Nevada Department of Water Resources (NDWR), this unit may be 100 feet thick in the area of the Site. The shallow groundwater system that has been investigated to define the distribution of the PCE within the Site is within the upper 30 to 60 feet of the Las Vegas Wash Aquitard.

The geology of the Site consists of interbedded layers and lenses of sand, sandy silt, sandy clay, and silty clay, along with scattered, discontinuous layers and lenses of caliche, silty sand, and gravelly sand. Lithologic data are available for borehole logs from 46 monitoring wells installed at the Site between 2000 and 2013. Additional lithologic information was obtained from 29 soil borings drilled for characterization of source area soils (URS 2007a), and from borings installed for active soil-gas sampling in and adjacent to the residential neighborhood (URS 2007b). In July 2012 and January-March, 2013 Tetra Tech completed deeper borings west and east of the Boulevard Mall (see Section 2.1.1 of the main text) that provided lithological information for depths previously not investigated. In addition, generalized driller's logs (746 and 620 feet deep) are available for irrigation wells PW-1 (DWR #5675) and PW-2 (DWR #16296) at the Las Vegas National Golf Course. Depths of monitoring wells at the Site range between 20 and 110 ft, although most wells are completed at depths between 30 and 35 feet.

South-North cross sections constructed for two areas of investigation west and east of the Boulevard Mall (included as Figures 5 and 6 in the main report) indicate that approximately 20 ft of unsaturated materials are composed primarily of sands and silts. However, some portions of the unsaturated zone may consist entirely of sandy clays and clays. The upper 40 ft of the saturated zone consist of sands and silty sands, which tend to interbed with lower permeability clays and silts, and include lenses of caliche. A confining unit of predominantly fine-grained materials is present from approximately 60 to 90 ft bgs. Below 90 ft bgs is a unit of relatively more permeable materials (silty sands, sandy silts) with lenses of clay. West-East cross section (included as Figure 7 the main report), oriented parallel to the central line of the PCE plume in groundwater, further illustrates these main units. As indicated by water level measurements in shallow and deep monitoring wells, the bottom of the shallow groundwater system is approximately 60-65 ft bgs, while the unit below 90 ft bgs belongs to a deeper groundwater system.

As shown on the geologic cross sections for the upper 60 feet bgs in two areas west and east of the Boulevard Mall (see Figures 2 and 3), lower permeability materials (silty clay, sandy clay, clayey silt, and sandy silt) dominate the saturated zone of the shallow groundwater system. However, 5- to 20-foot-thick lenses of silty sand or poorly graded sand are present beneath the water table or underlie the clayey units. Both cross sections indicate that lenses of clay and caliche may act as semi-confining or confining layers for the shallow groundwater system as corroborated by measurements of groundwater elevations. First groundwater encountered during drilling of wells MW-14I and MW-19I was at 2 or more feet lower than the static water level. Therefore, at some locations of the Site, shallow groundwater system may act as a semi-confined (leaky) or confined aquifer. Boring logs for wells shown on the cross sections are provided in Attachment 1.

Depth to groundwater generally ranges from 9 to 28 feet below ground surface (bgs) across the Site. Based on water level data, shallow groundwater flows east with a gradient that ranges from 0.014 to 0.017 ft/foot. Historical groundwater elevations indicate the water table fluctuates seasonally. Since May 2005 (following one of the wettest seasons), groundwater levels have declined by about 4-5 feet through 2012.

Groundwater in the Las Vegas Wash Aquitard is generally brackish and considered non-potable, with total dissolved solids (TDS) ranging from 900 to 4,300 milligrams per liter (mg/L) in monitoring wells installed across the Site (Tetra Tech 2011). Water quality in the Las Vegas Wash Aquitard generally degrades in an easterly, downgradient direction, with increasing concentrations of TDS, sulfate, and sodium. The elevated salinity results from evapotranspiration, dissolution of saline minerals in soils and rocks, and infiltration of irrigation water (Zikmund 1996). Groundwater in the Las Vegas Wash Aquitard within the area of the Site is a calcium-magnesium-sulfate water with a lesser bicarbonate component (Leising 2004).

The remaining sections of this document discuss the pumping test methods (Section 2.0) and summarize results of the aquifer tests and interpretation (Section 3.0). Section 4.0 presents conclusions and offers recommendations.

2.0 METHODS

Tetra Tech conducted pumping tests downgradient of the MSSC within two investigation areas on the Boulevard Mall property: (1) east of the Boulevard Mall (Eastern Parking Lot Area) and (2) west of the Boulevard Mall (MW-14 Area). Step-drawdown and constant discharge tests took place within the Eastern Parking Lot Area from July 31 through August 4, 2012, and within the MW-14 Area from August 6 through 12, 2012. The test procedures are discussed in subsequent sections; additional details are accessible in the field notes provided as Attachment 2.

The test procedures included setup and calibration of the equipment, and water level measurements in the pumped and observation wells. Discharge water was treated for volatile organic compounds (including PCE) and TDS, and was collected in an on-site holding tank prior to disposal. Approval to discharge the treated water under the De

Minimis Discharge Program by the NDEP Bureau of Water Pollution Control was granted on October 1, 2013 (Attachment 3).

The following sections summarize the test setup and equipment used during aquifer testing, as well as procedures for each type of test that was performed.

2.1 AQUIFER TEST SETUP

The aquifer test equipment setup is illustrated on Figure 4. The same test setup was used at each investigation area.

Testing equipment included an electric submersible pump (Grundfos 5 SQ-90, 3-inch diameter) set into the pumping well at the top of the well screen to maximize available drawdown. A discharge hose was connected to a filter bag assembly that would remove any suspended solids. In front of the filter bag assembly, a valve and a flow meter were installed in line to control the discharge rate and to measure instantaneous and total flow from the well.

Pumped water was treated after passing through a system of 5-micron filter bags, a coconut-shell activated carbon vessel (to remove PCE), and an ion-exchange vessel (to remove TDS), and was then piped to a 18,000-gallon on-site holding tank. The carbon vessel contained 1000 pounds of virgin coconut carbon. Treatment and water storage areas were bermed for secondary containment of potential spills (see Figure 4).

To monitor water levels during tests, a pressure transducer, a Level TROLL 700 (with a cable vented to the atmosphere), was installed in the pumping well slightly above the pump to accommodate the maximum drawdown anticipated for the well. The same type of pressure transducers were installed in the nearby observation wells.

Because vented transducers were used, a separate transducer was not installed to monitor barometric pressure changes throughout the duration of the tests. Planned pumping was expected to generate drawdowns in observation wells that would significantly exceed level fluctuations resulting from atmospheric pressure changes.

The transducers/dataloggers were programmed by setting the level reference to zero, and continuously recording three parameters (pressure, temperature, and water level) at a logging rate of one reading per second. Static water levels in wells were measured before the test start.

2.2 STEP DRAWDOWN TEST

A step-drawdown or step-rate test was conducted to establish the optimum pumping rate for the long-term constant discharge pumping test. The step-drawdown test within each investigation area consisted of pumping from the extraction well at successively

increasing flow rates. Because of time constraints in the field, a 30-minute duration of pumping was selected for each step of the test.

Flow rates were monitored throughout the duration of each step of the test and adjusted to maintain the target step rate by adjusting a flow valve. Water levels in the pumped well and the nearest observation well were recorded using pressure transducers, and were also measured manually as a check. Water level recovery was monitored and recorded following the last step of the test; the level was allowed to completely recover to static prior to starting the constant discharge test. Treated discharge water from the tests was stored in the on-site holding tank.

2.2.1 Eastern Parking Lot Area

Well MW-19I was used as a pumped well for the step-drawdown test within the Eastern Parking Lot Area of the Boulevard Mall. Well MW-19 was used as an observation well during the test. Both wells were equipped with pressure transducers. Locations of wells in plan view and cross section are shown on Figures 1 and 3.

2.2.2 MW-14 Area

Well MW-14I was used as a pumped well for the step-drawdown test within the area west of the Boulevard Mall. Well MW-14 was used as an observation well during the test. Both wells were equipped with pressure transducers. Locations of wells in plan view and cross section are shown on Figures 1 and 2.

2.2.3 Test Results

Results of the step tests in each investigation area indicated that the pumping rate for the constant discharge test should be about 1 gallon per minute (gpm). In addition, data from the step tests could be used for preliminary estimation of the aquifer hydraulic parameters. Results of the step test interpretations are discussed in Section 3.1.

2.3 CONSTANT DISCHARGE PUMPING TEST

The constant discharge aquifer tests took place within each investigation area after completion of step-drawdown tests and return of water levels to static. Based on results of the step test, pumping rates of 1 gpm were selected for the constant discharge tests. Section 3.1 provides additional details regarding the procedure of selecting rates.

Flow rates in the pumped wells were monitored throughout the duration of the test and adjusted to maintain the target rate by adjusting a flow valve. Water levels in the pumped well and the observation wells were recorded using pressure transducers, and were also measured manually—frequently during the first few hours after initiation of the tests and every hour to 2 hours throughout the pumping period. Water level recovery was monitored and recorded after turning the pump off. Treated discharge water from the tests was stored in the on-site holding tank.

2.3.1 Eastern Parking Lot Area

The constant discharge test setup within the Eastern Parking Lot Area of the Boulevard Mall included pumped well MW-19I and three observation wells: MW-19, MW-20, and MW-CMT1 located 40 to 90 feet from the pumped well (see Figures 1 and 3).

All wells except MW-CMT1 were equipped with pressure transducers. The transducers/data-loggers were programmed to record changes in water levels from the beginning of pumping, so the recorded water level reflected the drawdown. A logging rate for water levels was set at one reading per second.

Well MW-CMT1 is a continuous multi-channel tubing well, for which transducers were not available. A slim water level sounder was used to collect water level measurements in this well. Static water levels were measured in all four wells before the test start.

2.3.2 MW-14 Area

The constant discharge test setup within the area west of the Boulevard Mall included pumped well MW-14I and three observation wells: MW-14, MW-6, and MW-13 located 40 to 231 feet from the pumped well (see Figures 1 and 2).

Wells MW-14, MW-6, and MW-13 were equipped with pressure transducers. The transducers/dataloggers were programmed to record changes in water levels from the beginning of pumping, so the recorded water level reflected the drawdown. Based on the 72-hour test within the Eastern Parking Lot Area, a logging rate for water levels at one reading per second resulted in the datalogger memory overflow issues. Therefore, a logarithmic sampling interval was used for wells during the 77-hour constant discharge test within the MW-14 area. Initial data were collected at 0.01-minute intervals. Intervals were increased towards the end of pumping period to a maximum of 4 hours. Static water levels were measured in all four wells before the start of the test.

2.3.3 Test Results

Results of the constant discharge tests within each investigation area were used for estimation of the aquifer hydraulic parameters. Results of the test interpretations are discussed in Section 3.3. The estimated parameters are defined and briefly discussed below.

Transmissivity (T) of an aquifer is a measure of how much water can be transmitted horizontally to a pumping well. Transmissivity is directly proportional to the thickness of an aquifer (b) and is calculated as $T = K\,b$, where K is hydraulic conductivity. The dimensions of transmissivity are area per time.

The storage coefficient characterizes ability of an aquifer to store water. The storage coefficient (S) of an aquifer represents a volume of water released from an aquifer per 1 foot surface area per 1 foot change in head. The potential range of the S value

depends on whether the aquifer is confined or unconfined. In a confined aquifer setting, the load on top of an aquifer is supported by the solid rock skeleton and the hydraulic pressure exerted by water (the hydraulic pressure acts as a support mechanism). Water derived from storage of a confined aquifer is due to: (1) expansion of water as the aquifer is depressurized (pumped) and (2) compression of the aquifer. Because of these variables, the storage coefficient of most confined aquifers ranges from 0.00001 to 0.001. Conversely, in an unconfined aquifer setting, the predominant source of water is from gravity drainage, while expansion of water and compaction of the rock skeleton is negligible. Thus, in an unconfined aquifer, the storage coefficient is approximately equal to a value of specific yield and ranges from 0.1 to about 0.3.

3.0 AQUIFER TEST RESULTS

This section discusses how the pumping test data were analyzed and interpreted, and presents results of interpretation for each of the investigation areas.

Data obtained from the pumping tests were used to calculate the transmissivity and storage coefficient of the shallow water-bearing zone beneath the site. In addition, specific capacity values and well efficiency were estimated for pumped wells MW-14I and MW-19I within each investigation area.

A summary of field information for the step-drawdown and constant discharge tests is provided in Table 1. Table 2 summarizes results of the step drawdown tests interpretation. Table 3 provides details on the pumping and observation wells used in the pumping tests, including maximum drawdown observed in wells. Input parameters for the AQTESOLV program are summarized in Table 4. Table 5 lists estimates of transmissivity and storage coefficient obtained on a well by well basis from the step test and pumping tests. In addition, Table 5 also provides estimates of hydraulic conductivity of the materials in which the test wells are screened.

3.1 STEP TEST DATA INTERPRETATION

Step test data were used to determine the optimal pumping rate for the constant rate pumping tests and calculate well specific capacity and efficiency. Step drawdown data were plotted in the field (see Figures C1 and C3 in Attachment 4) to determine the optimal pumping rate for the constant rate pumping test.

These data allowed estimating a specific capacity for each pumped well, although the drawdowns were not sufficiently stabilized at the end of each step for well MW-14I. Specific capacity expresses the well yield per unit of drawdown (Driscoll 1995). Thus, specific capacity for each pumped well was determined by dividing the step-specific pumping rate by the respective drawdown. The highest estimated specific capacities for wells MW-19I and MW-14I correspond to lowest pumping rates, and are 0.16 and 0.09 gpm per foot of drawdown, respectively (see Table 2). The estimated values of specific capacity appeared low for both wells and suggested selecting a lower pumping rate for the subsequent constant discharge pumping test.

The drawdown versus time plots further were used to evaluate the well efficiency of the pumping well during the step drawdown test based on the method developed by Jacob (1964) and Bierschenk (1974). For wells with turbulent flow, Jacob (1964) suggested that the drawdown in a well might be more accurately expressed as the sum of a first-order (laminar) component and a second-order (turbulent) component, as follows:

$$s = BQ + CQ^2$$

where:

s = Drawdown (L)

Q = Pumping rate (L^3/T)

BQ = Formation loss (laminar term, reflects the head loss resulting from aquifer permeability)

CQ^2 = Well loss (the turbulent term, reflects the head loss attributable to hydraulic resistance of well screen or, in other words, to well inefficiency).

This equation can be expressed in linear form:

$$\frac{s}{Q} = B + CQ$$

and it can be solved graphically by plotting s/Q against Q to produce a straight line, where B is the intersect on the y-axis and C the slope of the line (Brassington 2007). It is then possible to calculate well efficiency at each pumping step using the following equation:

$$\text{Well Efficiency} = \frac{BQ}{BQ+CQ^2} \times 100$$

Well efficiency of each pumped well decreased from 74 to 60 percent when pumping rates increased from approximately 1 to 1.4 or 1.9 gpm, respectively (Table 2). Both wells appeared most efficient when pumping at approximately 1 gpm. Based on this information, a rate of 1 gpm was selected for constant discharge test within each investigation area.

3.2 CONSTANT DISCHARGE TEST DATA INTERPRETATION

This section summarizes the drawdown response characteristics and casing storage effects observed during constant discharge tests within each investigation area. Time-drawdown plots for both the pumped and observation wells for each test are included in Attachment 3. The test data were interpreted using AQTESOLV version 4.5 (HydroSolve, Inc. 2007), an aquifer test solution program. The AQTESOLV printouts of

the pumping test interpretation results are provided in Attachment 5. The estimated hydraulic parameters are summarized in Table 5.

3.2.1 Casing Storage Effects

Because pumping was conducted at a low flow rates, the casing storage of the pumped well could affect interpretation of test results. To determine the time when casing storage effects become negligible, the following formula was used (Schafer 1978, as cited in Driscoll 1995):

$$t_c = 0.6\ (d_c^2 - d_p^2)/Q/s$$

where:

t_c = critical time when casing storage effect becomes negligible

d_c = inside diameter of well casing (inches)

d_p = ouside diameter of pump column pipe (inches)

Q/s = specific capacity of the well in gpm/foot at time t_c

The equation above requires that the drawdown s at time t_c be known, as two unknowns are in the equation. However, t_c can be calculated iteratively by choosing initial s from the time-drawdown curve and repeating calculations until the calculated t_c does not change (Driscoll 1995).

For well MW-19I, d_c = 4 inches, d_p = 3 inches, and Q = 0.94 gpm throughout 72-hour pumping. Based on these inputs, the time when casing storage effect in well MW-19I becomes negligible is estimated at 14.5 minutes since start of pumping. For well MW 14I, pumped at 1 gpm for 77 hours, the casing storage effect was estimated to become negligible after 32 minutes since start of pumping. Accordingly, the type curves were fitted to the portion of the time-drawdown data when well storage effects became insignificant.

3.2.2 Eastern Parking Lot Area

The constant discharge pumping test within the Eastern Parking Lot Area included 72 hours of continuous pumping at a rate of 0.94 gpm, which resulted in a maximum drawdown in the pumped well of 3.9 feet (see Table 1). However, all observation wells responded to pumping only with small drawdowns of approximately 0.03 – 0.04 foot (see Table 3). After the pump was turned off, the water levels in both the pumped well and observation wells continued to be monitored for several hours until complete recovery. During the pumping test, more than 4,000 gallons of water was extracted and treated.

The drawdown in well MW-19I at the end of 72-hour pumping period measured only 3.9 feet. Both well development and step test indicated well MW-19I to be poorly producing. As can be seen on cross section (Figure 3), the available drawdown is

limited to approximately 10 feet. Pumping at 1.4 gpm at the last 30-minute step resulted in drawdown of 10.2 feet (see Table 1). By selecting a pumping rate of 0.94 gpm for the 72-hour constant discharge test, it was expected that water level would not be drawn below the top of the well screen.

However, pumping of MW-19I during the step test may have resulted in some additional well development, which likely improved its overall efficiency. Based on a weak response of the observation wells MW-19 and MW-20, the selected long-term pumping rate appears too low to stress the aquifer sufficiently in the allotted time for the test. Therefore, data from the observation wells obtained during the constant discharge test were used with caution for determining the hydraulic parameters. As a supplement, the time-drawdown data from MW-19 obtained from the step test, as well as recovery data for the pumped well, were used to assist in increasing confidence in the estimated parameters.

3.2.3 MW-14 Area

After pumping of MW-14I at an average rate of 1 gpm for 77 hours, all the observation wells at the area showed a good response to pumping with drawdowns of 0.11 to 0.23 foot (see Table 3). After the pump was turned off, water levels in both the pumped well and observation wells continued to be monitored for several hours until complete recovery. During the pumping test, more than 4,600 gallons of water was extracted and treated.

Time-drawdown data obtained from all observation wells within the NW-14 Area were more confidently interpreted than were well data from the Eastern Parking Lot Area. The following section provides details on pumping test data interpretation.

3.3 Selection of Analytical Models for Data Interpretation

The test data were interpreted using AQTESOLV version 4.5 (HydroSolve 2007), an aquifer test solution program. The AQTESOLV program used for test data interpretation allows matching the observed time-drawdown data to theoretical standard curves (type curves). Based on the matched curves, the program calculates transmissivity (T) and storage coefficient (S). Hydraulic conductivity (K) is calculated by dividing the transmissivity value by the aquifer thickness value (b).

As supported by the cross sections constructed for both investigation areas (see Figures 2 and 3) and discussed in Section 1.2, the site lithology and hydrogeology conditions are interpreted to correspond to a confined or leaky confined aquifer. Therefore, the Theis (1935)/Hantush (1961) solution for a pumping/recovery test with a constant discharge rate in a confined aquifer with partial penetration was selected as the appropriate method for data analysis. Some data sets were also evaluated by Hantush (1960) solution for a pumping/recovery test in a leaky confined aquifer without storage in adjacent aquitards. However, in majority of cases, Theis/Hantush solution for a confined aquifer was a better fit to the field data.

Numeric values for T and S were first automatically calculated by the software program from the match of the drawdown curves for observation wells to the standard curves (see Attachment 5). However, final interpretations for both test areas were derived using visual curve-fitting to data and accounting for casing storage effects exhibited by the extraction wells.

The analysis methods assume radial flow to the pumping well in a homogeneous, isotropic, confined unit. The Hantush (1960) method also assumes vertical flow from overlying and underlying aquitards into the pumped zone. The equations and assumptions for both methods are detailed in the AQTESOLV user's guide (Hydrosolve, Inc. 2007).

Evaluation of recovery data was conducted using Theis (1935) straight-line solution for determining T and S from residual drawdown data obtained during the recovery phase of the pumping test. Recovery analyses are applicable to confined, homogeneous, isotropic aquifers of unlimited extent that are fully penetrated by a well pumped at a constant rate. The recovery data plots, especially for the pumped well MW-19I, showed deviation from the method conditions, with recovery occurring significantly quicker than expected. This indicates relatively low efficiency of the pumping wells (particularly MW-19I). Therefore, the recovery analyses were not considered in determining S based on recovery data for the pumped wells.

3.4 ESTIMATED HYDRAULIC PARAMETERS

Based on results of the step drawdown and constant discharge tests within the Eastern Parking Lot Area, the estimates of transmissivity (T), storage coefficient (S), and hydraulic conductivity (K) for the saturated zone average 64 ft^2/day, 0.0017, and 2.1 ft/day, respectively. The estimation of hydraulic conductivity assumed a 30-foot thickness of the saturated zone, and the estimated K values ranged from 1.1 to 3.4 ft/day, which are characteristic of silty sand and fine sand materials (Heath 1983, Domenico and Schwartz 1998). The estimated average anisotropy ratio K_z/K_r is approximately 0.005, which indicates much lower permeability of the subsurface materials vertically than horizontally.

Based on results of the step drawdown and constant discharge tests within the MW-14 Area (west of the Boulevard Mall), the estimates of T, S, and K for the saturated zone average 146 ft^2/day, 0.0009, and 4.2 ft/day, respectively. Based on the assumed 35-foot thickness of the saturated zone, the estimated K values ranged from 0.4 to 9.4 ft/day, which are characteristic of silty sand to medium clean sand materials (Heath 1983, Domenico and Schwartz 1998). The estimated average vertical to horizontal hydraulic conductivity anisotropy ratio (K_z/K_r) for the saturated water-bearing zone is approximately 0.013, which indicates nearly 100 times lower permeability of the subsurface materials vertically than horizontally.

Table 5 lists estimates of transmissivity and storage coefficient obtained on a well-by-well basis from the step tests and pumping tests. In addition, Table 5 provides

estimates of hydraulic conductivity, as well as the estimated anisotropy ratio K_z/K_r for the saturated water-bearing zone.

4.0 SUMMARY AND CONCLUSIONS

From July through August 2012, Tetra Tech conducted aquifer testing at the Maryland Square PCE Site to estimate the hydraulic properties (e.g., hydraulic conductivity, transmissivity, and storage coefficient) of geologic materials at the Site, and to obtain additional information on site hydrogeology.

Results of the step drawdown and 72- to 77-hour constant discharge tests within the Eastern Parking Lot Area and MW-14 Area (west of MSSC) are summarized as follows:

1. The formation in which pumped wells are screened supports only relatively low well yields, as indicated by the relatively low specific capacity for both pumped wells MW-14I and MW-19I of 0.07 to 0.16 gpm per foot of drawdown, which means that wells screened in the shallow water-bearing zone would not be productive and, therefore, are impractical for use in a pump-and-treat system.

2. On average, the estimated transmissivity and aquifer storage coefficient range from 64 to 146 ft^2/day and 0.0009 to 0.0017, respectively, which means that wells screened in the shallow water-bearing zone will have excessive drawdowns even at low pumping rates and, therefore, will render pump-and-treat system inefficient.

3. The average estimated hydraulic conductivity values range from 2.1 to 4.2 ft/day and correspond to silty and sandy materials of the saturated zone, which means that permeability of the tested materials in the shallow water-bearing zone is moderate. However, moderare permeability materials are likely present in the subsurface as thin disconnected lenses which would not support significant well yields.

Based on average hydraulic conductivity estimates and typical hydraulic gradients, the horizontal groundwater velocity at locations of the tests is estimated to range from 40 to 100 feet per year (ft/yr); with higher velocities associated with sand lenses of limited extent. Considering low total organic carbon (TOC) values reported in soil samples collected within both test areas, retardation of PCE migration due to sorption to organic carbon is expected to be low. Therefore, within the test areas, PCE migration rate with groundwater is likely to range from 30 to 70 ft/yr.

Estimates of hydraulic parameters obtained from the aquifer tests can be used for interpretation of the pilot tests, and for support of groundwater modeling applications and risk assessments.

BORING LOG
MW-14I

Project: Maryland Square Shopping Center	Borehole Depth: 55 feet bgs.	Sampling Method: Split spoon	Page 1 of 3
Location: 3661 S. Maryland Parkway	Borehole Diameter: 10 inches		
Project No.: 103P172824.01	Reviewed By: Becki Dano	Northing (feet): TBA	
Logged By: Vladimir Prilepin		Easting (feet): TBA	
Date Boring Started: 7/26/2012	Drilling Contractor: Cascade Drilling L.P.	Ground Surface Elevation (feet MSL): TBA	
Date Boring Completed: 7/26/2012	Drilling Method: HSA	Top of Casing Elevation (feet MSL): TBA	

Depth (feet bgs)	Drive Interval (% recovery)	Blow Counts	Time	Sample No.	USCS	Graphic Log	Interval and Lithologic Description	OVA (ppm, BZ = breathing zone)
							Borehole was cleared w/air knife to 4.5 feet bgs	
0							0-1.5 feet bgs. Asphalt/aggregate base	
1					SM		1.5-4.5 feet bgs. Very hard to break with air knife - very dense SILTY SAND	
2								
3								
4								
5								
6	50%						5-10 feet bgs. SILTY SAND, very pale brown, 10YR 7/3 to 10YR 8/2, 70-85% very fine sand, 15-30% silt with occasional gravels; loose, dry	0.0
7								
8								
9								
10							10-15 feet bgs, poor recovery. Same as above.	0.0
11								
12								
13								
14								
15	10%						15-20 feet bgs. Becomes very dense at ~18', pinkish white 7.5YR 8/2, CALICHE rocks in the core (1-2.5" in size, angular) at ~18.5'-20'; whitish dry; amount of silt and fines increases w/depth to ~40-45%	
16								
17								
18								
19					CA.			
20	50%

ATTACHMENT 2
FIELD NOTES

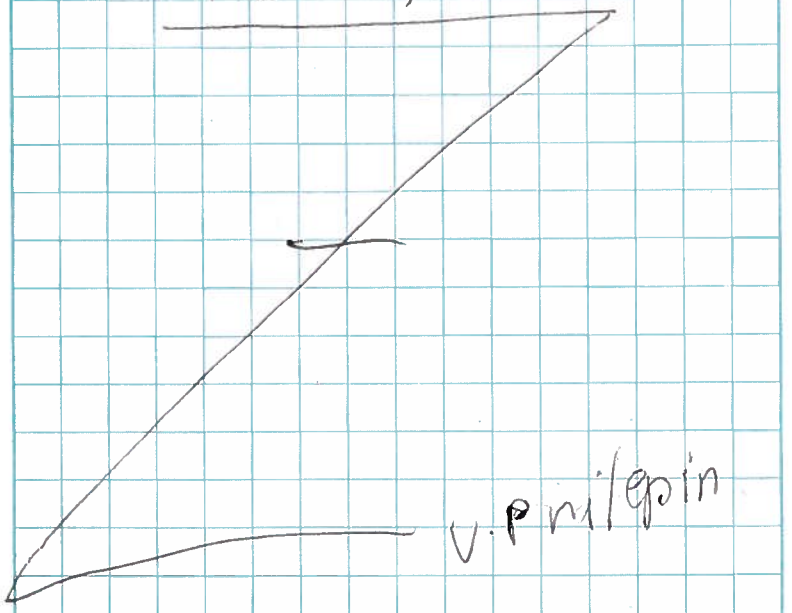
ATTACHMENT B
FIELD NOTES

Field Logbook No. 1 MSSC site Date 7/27/12

0:55 Completed EW-1 by pouring in Bentonite grout mixture ~ 130 gal

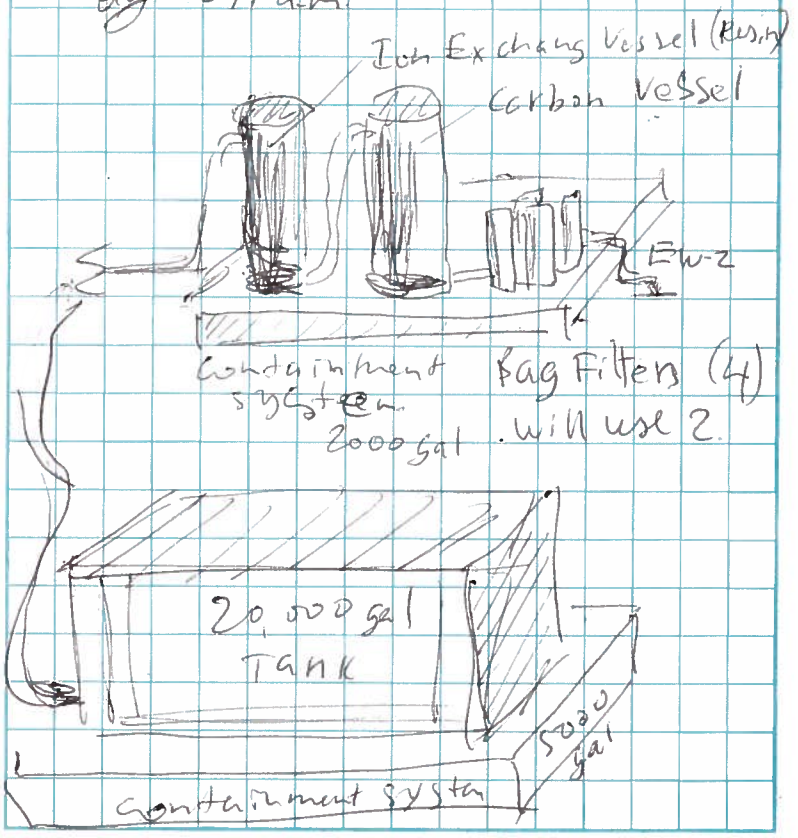
1:00 Spoke w/ Becki regarding plans for next week

1:10 Left the site (Becki will oversee surface completion of the well)



Field Logbook No. 1 MSSC site Date 7/30/12

11:30 Arrived to site from the airport; met w/ Dale Emerson. We went through each block of the treatment system that had been installed by ~11 am.



Field Logbook No. MSSC Site Date 7/30/12

12:15 Locked the gate. Dale will be working during nights at another site. He indicated we can talk at any time if questions arise

13:00 Tracy Spilotro called - the crew may not come until noon tomorrow I asked him to expedite mobilization as much as possible.

14:30 In the office, transducers and slim water level sounder already arrived, will set them up prior to setting into the wells.

15:00 Tracy Spilotro called to say that the crew w/ pump will arrive by 10 am tomorrow. I will meet them at the gate

Field Logbook No. MSSC Site Date 7/30/12

15-17:15 Preparation & water level measurements in up to 5 wells prior to the tests and during: tools; programming the transducers;

17:30 Left the office after coordinating w/ Becci Dano the upcoming activities (Becci will bring water level sounder - regular) In situ provided a slim sounder for MW-40.

18:30 Chid Christian called to inquire about subsurface geology at the Eastern parking Lot area and discuss a possibility of conducting tracer test. I replied that we'll have both the pumping test data and lab results for K, to calculate seepage velocity.

J. Pritepen.

Field Logbook No. IMSSC Site Date 7/31/12

8:30 At Target to buy field supplies & water

9:30 At the site; met w/ Rocki opened wells

10:30 Duke Emerson arrived; he brought Grundfos 3" pump

11:00 Rain for Dennis Tohn & Rodriguez (they installed treatment system.

11:30 Cascade crew arrived: Dale & Tessie - w/ well development rig; Tierced about moving up the pump & the GTS

Field Logbook No. IMSSC Site Date 7/31/12

11:40 PM's tailgate meeting.

12:00 Cascade crew went to lunch.

12:20 - 12:30 Depth to water measurements from N TOC.

17:45 Left the site to take a break before returning at ~9 pm to download data.

Dale Gains at the site watching for flow rate (kept steady at ~0.93 since

Field Logbook No. 1 MSSC Site Date 8/1/12

the start of the test. Jessie will come for this shift at 19:00. Because nearest observation wells didn't show a response after 8+ hours of pumping, we decrease w.l. measurement to every 2 hours, will increase it once measurable drawdown is observed.

21:05 arrived at site; Jessie is watching for flow rate and taking water level readings in MW-19, MW-20, MW-40.

- Checked dd in EW-2 via transducer – relatively stable; rate was also steady at 0.95–0.9

DD in EW-2 3.6'

21:30 Explained to Jessie,

Field Logbook No. IMSSC Site Date 8/1/12

that it's important
to monitor dd in
the pumping well
(every hour readings
are required)

21:40 Removed dedicated
water level sounder
from MW-20. (no
change in level
after ~13h of
pumping; decided it
and used to
measure w.l. at EW-2.

22:04 DTW ft BTOC EW-2:
(= 30.44 ft), i.e.
~3.5' available to
the top of well screen.
(34' below TOC)
dd ~ 3.589, Total Q =
= 709 gal.

J. Prieto

22:15 left the site

Field Logbook No. IMSSC Site Date 8/2/12

7:30 Spoke w/ Dale Coons
(he ~~met w/~~ replaced Jessey
at 7 am.
During the night shift
flow rate remained stable

Drawdown at EW-2 was
slightly increasing.

8:00 Spoke w/ PTS Labs
(they didn't receive
TT's authorization to
proceed w/ analyses) since
last Friday.
I signed the authorization
form on behalf of ROB
and sent it via e-mail
to Rachel at PTS Lab.

9:00 and on e-mail commu-
nication w/ team members,
data interpretation and
evaluation of lab data
received to date: ATC,
CARUS Lab (PAIOD).

Field Logbook No. IMSSC Site Date 8/2/12

12:00 Arrived at site; met w/ Dale.
- flow rate is stable: 0.95-0.93
Total gallons. ~ 1,540

No significant response in observation wells yet.

13:00 Measured levels in EW-2, MW-19, MW-40

DTW at EW-2 is pretty stable only 0.2' increase since last night

Flow rate keeps on at 0.95 gpm

No significant response in wells MW-19, MW-40 (MW-20 is currently not monitored, because water level meter is used for EW-2

14:00 measured levels in EW-2 - steady, same as rate

Field Logbook No. IMSSC Site Date 8/2/12

15:30 stopped by the site, drawdown at EW-2 is stable DTW. 30.64

15:30 - 16. Took a short trip to a golf course to take some pictures of the topography, ponds, wash etc

21:10 Arrived at the site to download transducer data. Jesse is monitoring flow rate, water levels in EW-2 MW-19 MW-40 since 7p.m. (he replaced Dale)

It took about 40 minutes to download EW-2 Transducer data.

23:00 Began downloading data from MW-90 (~47 min).

12:50 Left the site

Field Logbook No. I MSSC Site Date 8/3/12

9:35 spoke w/ Dale - pumping rate is stable, no significant changes to water levels in obs. wells either

13:00 Dale noticed a slight drop in pumping rate to 0.81 from 0.9's (regular)

13:10 The rate was adjusted with a valve to ~0.95.

14:20 Arrived at the site current readings:
Q ≃ 0.98

14:52 Total Q = 3,033
Q = 0.98 - 1.00
EW-2:
S = 4,032.

~16:00 Stopped by - all pump meters SS

Field Logbook No. I MSSC Site Date 8/3/12-8/4

22:00 Talked w/ Jesse; the dd. in EW-2 increased by 0.2'; rate is stable; obs. wells unchanged

23:20 started downloading the data

00:00 Let Jesse to take a nap while downloading transducer data (will take a couple of hours from 3 wells).

00:10-00:25 - measured levels in EW-2, MW-19 and MW-40 (see Cascade forms)

00:20 Jeep with two people entered the site and asked one man about the tanks. (they probably intended to steal something). I escorted them off site and closed the gate.

00:55 Reprogrammed

Field Logbook No. LMSSC Site Date 8/4/12

transducer for EW-2

(at 10:48 am. 8/3 its memory got full, so about 9 hours of data were not recorded – We have manual readings though).

Set transducer referen to the current DTW

3.915' + read

every 15 sec, not 1sec.

current depth 20.359

1:15 Reprogramming transducer at MW-19 after downloading the data (~48 min)

Current reading 0.042'

Field Logbook No. LMSSC Site Date 8/4/12

2:13 Deleted full log for MW-19 transducer (after saving)

Set new reference at current value of 0.042

Tr. depth 2.281'

2:30 Began downloading data from MW-20 transducer

3:00 Measured levels in EW-2, MW-19, MW-20

3:15 Download complete for MW-20 reprogrammed to record last ~6 hours of the test

Ref. 0.043
depth reading 4.293

3:37. Left the site

RENO, NV 89509

Dear: MS. TAMARA PELHAM

Re: De Minimis General Permit: NVG2010000

Project ID Number: DDP - 157

Category 3: Yes

Project Name: Boulevard Mall

Your submittal to be included under the De Minimis General Permit has been approved effective 10/01/2012 .

Please note that Nevada Administrative Code (NAC) 445A.268 Section (5)(b) reads, in part, that a Permittee (discharger) who is covered under a general permit shall pay to the Director a nonrefundable fee of $200 not later than July 1 of each year that the discharger is covered under that permit.

To Terminate coverage of the Nevada NPDES General Permit for De Minimis Discharges, the Permittee must submit a Notice of Termination ("NOT") form when their facilities no longer have any De Minimis discharges associated with the site identified in this application for General Permit coverage.

Should you have any questions, I can be reached at (775) 687-9468.

Sincerely,

Alexi Lanza , P.E.

De Minimis Discharge Permit Program

Nevada Division of Environmental Protection

CC: Ms.Tamara Pelham Tetra Tech 639 Isbell Road Suite 390 Reno NV 89509

NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM PERMIT

NVG201000

In compliance with the provisions of the Clean Water Act (33 U.S.C. 1251 et. Seq. the "Act") and the Nevada Revised Statutes (Chapter NRS 445A), eligible dischargers who have submitted a Notice of Intent (NOI) and filing fee in accordance with Nevada Administrative Code (NAC) 445A.268, are authorized to discharge

DeMinimis discharges as defined in this permit

To :

Waters of the United States

In accordance with conditions set forth in Parts A, B and C hereof,

This permit became effective on February 11th, 2011.

This permit was modified and shall become effective on July 30th, 2012.

This permit and authorization to discharge shall expire at Midnight, February 11, 2016

Signed this 8th day of August, 2012

Alexi Lanza, P. E.
Bureau of Water Pollution Control
Nevada Division of Environmental Protection

A PART I - GENERAL PERMIT CONDITIONS

A.1 PERMIT OBJECTIVE:

A.1.1 GNV201000 is for DeMinimis discharges as defined below and may be intermittent or continuous. Its purpose is to provide timely authorization for discharges to Waters of the United States. This general permit establishes Notice of Intent (NOI) requirements, water quality limitations, prohibitions and management practices for five (5) separate discharge categories. For each discharge, a separate permit is required.

A.2 PERMIT COVERAGE:

A.2.1 This General Permit covers the State of Nevada.

A.3 **DISCHARGE CATEGORIES**: Category 1is hereby established as DeMinimis and shall report the duration and quantity in accordance with Section A.9.1.1. Category 2 is hereby established as DeMinimis and up to 1500 gallons per minute (gpm). Categories 3, 4, and 5 are hereby established as DeMinimis and shall be less than 250 gallons per minute (gpm):

A.3.1 **Category 1 – Public Water System (NRS 445A.235) Emergency discharges** – Permitted Public Water System Emergency discharges are a situations which pose an immediate risk to health, life, property or environment.

A.3.2 **Category 2 – Existing Public Water System supply discharges -** Permitted activities include discharges related to construction, maintenance, and testing (quantity, duration and capacity) of a public water system up to 1500 gpm (including the pipes, tanks, and reservoirs) such as:

A.3.2.1 Disinfection and flushing activities;

A.3.2.2 Discharges resulting from pressure releases, or overflows;

A.3.2.3 Discharge from wells and storage reservoirs;

A.3.2.4 Drilling of **NEW** Public Water System wells; or,

A.3.2.5 Public Water System discharges from other devices.

A.3.3 **Category 3 - Well development, testing & maintenance / aquifer testing / water quality testing -** Permitted discharges include discharges of water associated with:

A.3.3.1 Drilling of **NEW** wells (excluding Public Water System wells);

A.3.3.2 Rehabilitation or maintenance of water or geothermal wells, piezometers, and boreholes;

A.3.3.3 Water supply quantity or quality evaluations;

A.3.3.4 Well/aquifer test pumping and/or purging;

A.3.3.5 Discharges from any borehole not fully developed.

A.3.4 **Category 4 - Subsurface water discharges** - Permitted discharges include:

A.3.4.1 Groundwater from foundation, footer drain, basement, underground structure or other dewatering, provided the discharge is not contaminated with pollutants, chemicals or co-mingled with other wastewaters;

A.3.4.2 Water from intercepted or pumped groundwater.

A.3.5 **Category 5 - Utility vault water discharges** - Permitted discharges include:

A.3.5.1 Groundwater or surface water collected in vaults;

A.3.5.2 Water from subterranean seepage;

A.3.5.3 Snow melt, storm water, or water present as a result of inclement weather.

A.4 **PROHIBITED DISCHARGES:** Discharges not covered by this permit include:

A.4.1 Discharges in excess of 250 gpm, except as defined in Categories 1 and 2 (above);

A.4.2 Category 3. Category 4, or Category 5 type discharges that are within the BMI Complex as defined in Attachment I;

A.4.3 Discharges that are subject to effluent limitation guidelines at 40 CFR Part 440;

A.4.4 Discharges near or adjacent to hazardous waste sites, remediation sites, or where discharge activities may encounter naturally occurring constituents that would cause a violation of Water Quality Standards;

A.4.5 Subsurface (tile) drainage systems(or equivalent);

A.4.6 Discharges from mining activities;

A.4.7 Leaking chemical and fuel tanks;

A.4.8 Discharge of industrial waste;

A.4.9 Discharge of domestic/sanitary waste;

A.4.10 Biohazardous waste (e.g. wastes from hospitals, dentists, and/or veterinary clinics);

A.4.11 Discharges authorized by other NDEP permits;

A.4.12 Discharges that are not in conformance with an approved Total Maximum Daily Load

(TMDL);

A.4.13 Discharges into impaired waters on the Federal Clean Water Act Section 303(d) list, unless the discharge does not contain the pollutant for which the waterbody is impaired, or does not cause or contribute to an exceedance of water quality standards; or that there are sufficient remaining wasteload allocations in an EPA approved or established TMDL to allow the discharge.

A.4.14 Discharges from vehicle or equipment washing or maintenance activities including mobile washes (e.g. car, carpet, animal, and heavy equipment);

A.4.15 Underground injection control (UIC) activities;

A.4.16 Continuous discharges from existing geothermal wells or sources;

A.4.17 Working in Waters of the U.S.; or,

A.4.18 Discharges not authorized under this permit.

A.5 ELIGIBILITY, PERMIT REQUIREMENT, AND REQUEST FOR INCLUSION

A.5.1 All facilities or persons who are planning on conducting any discharge activities described in Section A.1 are eligible for this general permit.

A.5.2 Existing dischargers who are covered under a current Permit may continue to discharge until such valid permit expires.

A.5.3 The Division may require the holder of this General Permit apply for and obtain an individual permit in accordance with NRS 445A.480

A.5.4 Water quality standards included in this permit are promulgated by the Nevada Division of Environmental Protection (NDEP); current toxicity standards are defined in **NAC 445A.1236** – Standards for toxic materials applicable to designated waters.

A.5.5 New water quality standards for chlorine, toluene, ethylbenzene, *escherichia coli (*e. coli) and fecal coliform are being considered by NDEP. If adopted, these new standards may be included in general permit NVG201000 as a "minor permit modification".

A.5.6 To apply for permit coverage all new qualifying dischargers must request inclusion under this permit by completing and submitting an approved NDEP Notice of Intent (NOI) application to the Division along with appropriate permit fees. **The NOI submittal shall be submitted through NDEP's online permitting system at** http://ndep.nv.gov/bwpc/.

A.6 NOI REQUIREMENTS:

A.6.1 The minimum information required on a NOI consists of the following:

A.6.1.1 Applicant Information:

A.6.1.1.1 Applicant Name, Phone, Address, City, State, and Zip Code.

A.6.1.2 Operator Information:

A.6.1.2.1 Operator Name, Phone, Address, City, State, and Zip Code.

A.6.1.3 Billing Information:

A.6.1.3.1 Billing Name, Phone, Address, City, State, and Zip Code.

A.6.1.4 Site Information:

A.6.1.4.1 Project Name, Address, City, State, Zip Code;

A.6.1.4.2 Discharge latitude and longitude; and,

A.6.1.4.3 Scaled Site location Map showing the path from the initial outfall to the point of discharge to the receiving water.

A.6.1.5 Discharge Information:

A.6.1.5.1 Estimated Start Date;

A.6.1.5.2 Estimated Completion Date;

A.6.1.5.3 Name of the Receiving Water

A.6.1.5.4 Estimated daily flow rate;

A.6.1.5.5 Category of Discharge the permittee is requesting; and,

A.6.1.5.6 Water quality results as required by the Applicable NOI submittal requirements in Section A, below.

A.7 CERTIFICATION:

A.7.1 A signed and dated NOI Certification statement in accordance with Section C of this permit (SIGNATURES, CERTIFICATION REQUIRED ON APPLICATION AND REPORTING FORMS)

A.7.2 If water discharge (disposal) is to property other than the Permittee's, a letter of authorization (from the property owner where the discharge is to occur that explicitly allows the discharge to occur) must be included with the NOI.

A.8 NOTICE OF TERMINATION (NOT) REQUIREMENTS:

A.8.1 An approved NDEP Notice of Termination (NOT) shall be submitted upon cessation of

discharge. NOT applications are available online at http://ndep.nv.gov/bwpc/.

A.8.2 The minimum information required on a NOT consists of the following:

A.8.2.1 General Permit and authorization number;

A.8.2.2 Discharge Operator / Permittee / Applicant information: name, address, city, county, state, zip code, and phone;

A.8.2.3 Project (Site) location information: project name, project address, city, county, state, zip code;

A.8.3 A signed and dated NOT Certification statement in accordance with Section C of this permit (SIGNATURES, CERTIFICATION REQUIRED ON APPLICATION AND REPORTING FORMS)

A.9 **DISCHARGE NOI REQUIREMENTS:**

A.9.1 Based on the Category of Discharge, the following parameters must be sampled and submitted with the permit NOI:

A.9.1.1 **Category 1 – Public Water System Emergency Discharges: NOI Requirements**

A.9.1.1.1 For each Public Water System Emergency Discharge, the permittee shall provide a draft narrative report that describes the location of the discharge;

A.9.1.1.2 The estimated duration of the discharge;

A.9.1.1.3 Estimated Quantity of discharge; and,

A.9.1.1.4 A description of where the discharge entered the Municipal Storm Sewer System (MS4) and/or the associated receiving water.

A.9.1.2 **Category 2 – Public Water System Supply discharges: Supplemental Application and NOI Sampling Requirements**

A.9.1.2.1 For each New Well discharge, the permittee shall provide a draft narrative report that describes:

A.9.1.2.1.1 The location of the discharge;

A.9.1.2.1.2 The estimated duration of the discharge;

A.9.1.2.1.3 Estimated Quantity of discharge;

A.9.1.2.1.4 A description of the BMP's implemented to control drilling fluids, mud or material; and,

A.9.1.2.1.5 A representative water quality sample of the discharge.

A.9.1.2.2 For discharges in this category not associated with New well development, or where disinfection with chlorine based compounds were used, samples must be taken and submitted in accordance with the table below

Parameters	Discharge Limit - Daily Maximum	Measurement Frequency	Sample Type
Total Residual Chlorine[1] – mg/L	0.10	With NOI	Discrete
Total Dissolved Solids[2] (TDS) – mg/L	Monitor & Report	With NOI	Discrete
Turbidity – NTU [2, 3]	Monitor & Report	With NOI	Discrete

1. Only if disinfection with chlorine based compounds were carried out. Samples must be collected during the first hour of discharge. For discharges that extend beyond an hour in duration, a second sample shall be collected prior to end of discharge, or as specified by the division.
2. BMPs shall be implemented to minimize erosion and sediment.
3. During the discharge, if a visible turbidity plume is generated, a grab sample shall be obtained. Turbidity shall be less than or equal to 10 Nephelometric Turbidity Units (NTUs) over the background value of the receiving water.

A.9.1.3 Category 3 - Well development, testing & maintenance / aquifer testing / water quality testing: Supplemental Application and NOI Sampling Requirements

A.9.1.3.1 For each New Well development discharge, the permittee shall provide a draft narrative report that describes:

A.9.1.3.1.1 The location of the discharge;

A.9.1.3.1.2 The estimated duration of the discharge;

A.9.1.3.1.3 Estimated Quantity of discharge;

A.9.1.3.1.4 A description of the BMP's implemented to control drilling fluids, mud or material; and,

A.9.1.3.1.5 A representative water quality sample of the groundwater.

A.9.1.3.2 For discharges not associated with New well development, or where disinfection with chlorine based compounds were used, samples shall be taken and submitted in accordance with the table below.

Parameters	Discharge Limit - Daily Maximum	Measurement Frequency	Sample Type
Total Residual Chlorine[1] – mg/L	0.10	With NOI	Discrete
Total Dissolved Solids (TDS) – mg/L	Monitor & Report	With NOI	Discrete
Total Suspended Solids (TSS) – mg/L	Monitor & Report	With NOI	Discrete
Total Petroleum Hydrocarbon (TPH) (C6 – C40) – mg/L[5]	1.0	With NOI	Discrete
Methyl tert-Butyl Ether (MTBE) - µg/L	20.0	With NOI	Discrete
Total Nitrogen as N – mg/L	10.0	With NOI	Discrete
Total Phosphorus as P – mg/L	Monitor & Report	With NOI	Discrete
Trichloroethylene (TCE) - µg/L	5.0	With NOI	Discrete
Tetrachloroethylene (PCE) - µg/L	5.0	With NOI	Discrete

Benzene - µg/L	5.0	With NOI	Discrete
Ethyl benzene - µg/L	100	With NOI	Discrete
Toluene - µg/L	100	With NOI	Discrete
Xylene - µg/L	200	With NOI	Discrete
pH – S.U.	6.5 – 9.0	With NOI	Discrete
Turbidity – NTU[2, 3]	Monitor & Report	With NOI	Discrete
Barium – mg/L	2.0	With NOI	Discrete
Fluoride – mg/L	Monitor & Report	With NOI	Discrete
Iron – mg/L	1.0	With NOI	Discrete
Sulfate – mg/L	Monitor & Report	With NOI	Discrete
Dissolved Oxygen	Monitor & Report	With NOI	Discrete
Molybdenum - mg/L	6.16	With NOI	Discrete
Antimony	Monitor & Report	With NOI	Discrete
Arsenic	Monitor & Report	With NOI	Discrete
Beryllium	Monitor & Report	With NOI	Discrete
Boron	Monitor & Report	With NOI	Discrete
Cadmium	Monitor & Report	With NOI	Discrete
Calcium	Monitor & Report	With NOI	Discrete
Copper	Monitor & Report	With NOI	Discrete
Lead	Monitor & Report	With NOI	Discrete
Magnesium	Monitor & Report	With NOI	Discrete
Manganese	Monitor & Report	With NOI	Discrete
Mercury	Monitor & Report	With NOI	Discrete
Nickel	Monitor & Report	With NOI	Discrete
Selenium	Monitor & Report	With NOI	Discrete
Silver	Monitor & Report	With NOI	Discrete
Sulfur	Monitor & Report	With NOI	Discrete
Thallium	Monitor & Report	With NOI	Discrete
Zinc - total recoverable	Monitor & Report	With NOI	Discrete
Fecal Coliform - MPN100 mL	Monitor & Report	With NOI	Discrete
E Coli[4] - MPN/100mL	Monitor & Report	With NOI	Discrete
Hardness (expressed as $CaCO_3$) - mg/L	Monitor & Report	With NOI	Discrete

1. Samples must be collected during the first hour of discharge. For discharges that extend beyond an hour in duration, a second sample shall be collected prior to end of discharge, or as specified by the division.
2. BMPs shall be implemented to minimize erosion and sediment.
3. During the discharge, if a visible turbidity plume is generated, a grab sample shall be obtained. Turbidity shall be less than or equal to 10 Nephelometric Turbidity Units (NTUs) over the background value of the receiving water.
4. Single Value.
5. EPA Method 8015B and EPA Method 8260B, extractable and purgeable, C6-C40. Summation must meet permit limit.

A.9.1.4 Category 4 - Subsurface water discharges: NOI Sampling Requirements

Parameters	Discharge Limit Daily Maximum	Measurement Frequency	Sample Type
Total Residual Chlorine[1] – mg/L	0.10	With NOI	Discrete
Total Dissolved Solids (TDS) – mg/L	Monitor & Report	With NOI	Discrete
Total Suspended Solids (TSS) – mg/L	Monitor & Report	With NOI	Discrete
Total Petroleum Hydrocarbon (TPH) (C6 – C40) – mg/L[5]	1.0	With NOI	Discrete
Methyl tert-Butyl Ether (MTBE) - µg/L	20.0	With NOI	Discrete
Total Nitrogen as N – mg/L	10.0	With NOI	Discrete
Total Phosphorus as P – mg/L	Monitor & Report	With NOI	Discrete
Trichloroethylene (TCE) - µg/L	5.0	With NOI	Discrete
Tetrachloroethylene (PCE) - µg/L	5.0	With NOI	Discrete

Benzene - µg/L	5.0	With NOI	Discrete
Ethyl benzene - µg/L	100	With NOI	Discrete
Toluene - µg/L	100	With NOI	Discrete
Xylene - µg/L	200	With NOI	Discrete
pH – S.U.	6.5 – 9.0	With NOI	Discrete
Turbidity – NTU[2, 3]	Monitor & Report	With NOI	Discrete
Barium – mg/L	2.0	With NOI	Discrete
Fluoride – mg/L	Monitor & Report	With NOI	Discrete
Iron – mg/L	1.0	With NOI	Discrete
Sulfate – mg/L	Monitor & Report	With NOI	Discrete
Dissolved Oxygen	Monitor & Report	With NOI	Discrete
Molybdenum - mg/L	6.16	With NOI	Discrete
Antimony	Monitor & Report	With NOI	Discrete
Arsenic	Monitor & Report	With NOI	Discrete
Beryllium	Monitor & Report	With NOI	Discrete
Boron	Monitor & Report	With NOI	Discrete
Cadmium	Monitor & Report	With NOI	Discrete
Calcium	Monitor & Report	With NOI	Discrete
Copper	Monitor & Report	With NOI	Discrete
Lead	Monitor & Report	With NOI	Discrete
Magnesium	Monitor & Report	With NOI	Discrete
Manganese	Monitor & Report	With NOI	Discrete
Mercury	Monitor & Report	With NOI	Discrete
Nickel	Monitor & Report	With NOI	Discrete
Selenium	Monitor & Report	With NOI	Discrete
Silver	Monitor & Report	With NOI	Discrete
Sulfur	Monitor & Report	With NOI	Discrete
Thallium	Monitor & Report	With NOI	Discrete
Zinc - total recoverable	Monitor & Report	With NOI	Discrete
Fecal Coliform - MPN100 mL	Monitor & Report	With NOI	Discrete
E Coli[4] - MPN/100mL	Monitor & Report	With NOI	Discrete
Hardness (expressed as $CaCO_3$) - mg/L	Monitor & Report	With NOI	Discrete

1. Samples must be collected during the first hour of discharge. For discharges that extend beyond an hour in duration, a second sample shall be collected prior to end of discharge, or as specified by the division.
2. BMPs shall be implemented to minimize erosion and sediment.
3. During the discharge, if a visible turbidity plume is generated, a grab sample shall be obtained. Turbidity shall be less than or equal to 10 Nephelometric Turbidity Units (NTUs) over the background value of the receiving water.
4. Single Value.
5. EPA Method 8015B and EPA Method 8260B, extractable and purgeable, C6-C40. Summation must meet permit limit.

A.9.1.5 Category 5 - Utility vault water discharges: NOI Sampling Requirements

Parameters	Discharge Limit Daily Maximum	Measurement Frequency	Sample Type
Total Residual Chlorine[1] – mg/L	0.10	With NOI	Discrete
Total Dissolved Solids (TDS) – mg/L	Monitor & Report	With NOI	Discrete
Total Suspended Solids (TSS) – mg/L	Monitor & Report	With NOI	Discrete
Total Petroleum Hydrocarbon (TPH) (C6 – C40) – mg/L[5]	1.0	With NOI	Discrete
Methyl tert-Butyl Ether (MTBE) - µg/L	20.0	With NOI	Discrete
Total Nitrogen as N – mg/L	10.0	With NOI	Discrete
Total Phosphorus as P – mg/L	Monitor & Report	With NOI	Discrete
Trichloroethylene (TCE) - µg/L	5.0	With NOI	Discrete
Tetrachloroethylene (PCE) - µg/L	5.0	With NOI	Discrete

Benzene - µg/L	5.0	With NOI	Discrete
Ethyl benzene - µg/L	100	With NOI	Discrete
Toluene - µg/L	100	With NOI	Discrete
Xylene - µg/L	200	With NOI	Discrete
pH – S.U.	6.5 – 9.0	With NOI	Discrete
Turbidity – NTU[2, 3]	Monitor & Report	With NOI	Discrete
Barium – mg/L	2.0	With NOI	Discrete
Fluoride – mg/L	Monitor & Report	With NOI	Discrete
Iron – mg/L	1.0	With NOI	Discrete
Sulfate – mg/L	Monitor & Report	With NOI	Discrete
Dissolved Oxygen	Monitor & Report	With NOI	Discrete
Molybdenum - mg/L	6.16	With NOI	Discrete
Antimony	Monitor & Report	With NOI	Discrete
Arsenic	Monitor & Report	With NOI	Discrete
Beryllium	Monitor & Report	With NOI	Discrete
Boron	Monitor & Report	With NOI	Discrete
Cadmium	Monitor & Report	With NOI	Discrete
Calcium	Monitor & Report	With NOI	Discrete
Copper	Monitor & Report	With NOI	Discrete
Lead	Monitor & Report	With NOI	Discrete
Magnesium	Monitor & Report	With NOI	Discrete
Manganese	Monitor & Report	With NOI	Discrete
Mercury	Monitor & Report	With NOI	Discrete
Nickel	Monitor & Report	With NOI	Discrete
Selenium	Monitor & Report	With NOI	Discrete
Silver	Monitor & Report	With NOI	Discrete
Sulfur	Monitor & Report	With NOI	Discrete
Thallium	Monitor & Report	With NOI	Discrete
Zinc - total recoverable	Monitor & Report	With NOI	Discrete
Fecal Coliform - MPN100 mL	Monitor & Report	With NOI	Discrete
E Coli[4] - MPN/100mL	Monitor & Report	With NOI	Discrete
Hardness (expressed as $CaCO_3$) - mg/L	Monitor & Report	With NOI	Discrete

1. Samples must be collected during the first hour of discharge. For discharges that extend beyond an hour in duration, a second sample shall be collected prior to end of discharge, or as specified by the division.
2. BMPs shall be implemented to minimize erosion and sediment.
3. During the discharge, if a visible turbidity plume is generated, a grab sample shall be obtained. Turbidity shall be less than or equal to 10 Nephelometric Turbidity Units (NTUs) over the background value of the receiving water.
4. Single Value.
5. EPA Method 8015B and EPA Method 8260B, extractable and purgeable, C6-C40. Summation must meet permit limit.

A.10 DISCHARGE LIMITATIONS, MONITORING REQUIREMENTS AND CONDITIONS:

A.10.1 Samples taken in compliance with the monitoring requirements specified below shall be taken prior to discharge into the receiving water.

A.10.2 The discharge sample must be collected from an approved sampling location or taken from the end of the discharge pipe following the final treatment component of the system including BMPs.

A.10.3 During the period beginning on the effective date of this General Permit, and lasting until the General Permit expires, discharge activities shall be limited and, as applicable, monitored by the Permittee as specified by the tables in this section below.

A.10.3.1 Category 1 – Public Water System Emergency Discharges: Discharge Limitations, Monitoring Requirements and Conditions

A.10.3.1.1 For each Public Water System Emergency Discharge the permittee shall provide a Final narrative report that describes the location of the discharge;

A.10.3.1.2 The duration of the discharge;

A.10.3.1.3 Estimated Quantity of discharge;

A.10.3.1.4 A description of where the discharge entered the Municipal Storm Sewer System (MS4) and the associated receiving water;

A.10.3.1.5 A description of how the emergency event occurred;

A.10.3.1.6 A description of the corrective action to discontinue the discharge and the repair plan that was implemented;

A.10.3.1.7 Where applicable, a description of action taken to prevent a future discharge at the same location; and

A.10.3.1.8 A description of any environmental impacts that may have occurred as a result of the discharge.

A.10.3.2 Category 2 – Public Water System Supply discharges: Discharge Limitations, Monitoring Requirements and Conditions

Parameters	Discharge Limit Daily Maximum	Measurement Frequency[2]	Sample Type
Flow – gallons per minute (gpm)	1500	Continuous	Continuous
Total Residual Chlorine[1] - mg/L	0.10	Two/Discharge	Discrete
Total Dissolved Solids (TDS) - mg/L	Monitor & Report	Annual – 4th Qtr.	Discrete

1. Samples must be collected during the first hour of discharge. For discharges that extend beyond an hour in duration, a second sample shall be collected prior to end of discharge, or as specified by the division.
2. Test results to be submitted by **Jan 28th** of the calendar year.

A.10.3.3 Category 3 - Well testing and maintenance / aquifer testing / water quality testing: Discharge Limitations, Monitoring Requirements and Conditions

Parameters	Discharge Limit Daily Maximum	Measurement Frequency[2]	Sample Type
Flow – gallons per minute (gpm)	250	Continuous	Continuous
Total Residual Chlorine[1] - mg/L	0.10	Two/Discharge	Discrete
Total Dissolved Solids (TDS) - mg/L	Monitor & Report	Annual – 4th Qtr.	Discrete
Total Suspended Solids (TSS) - mg/L	Monitor & Report	Annual – 4th Qtr.	Discrete
Methyl tert-Butyl Ether (MTBE) - µg/L	20.0	Annual – 4th Qtr.	Discrete
Total Nitrogen as N - mg/L	10.0	Annual – 4th Qtr.	Discrete
Total Phosphorus as P	Monitor & Report	Annual – 4th Qtr.	Discrete
Trichloroethylene (TCE) - ug/L	5.0	Annual – 4th Qtr.	Discrete

Tetrachloroethylene (PCE) - ug/L	5.0	Annual – 4th Qtr.	Discrete
Benzene - ug/L	5.0	Annual – 4th Qtr.	Discrete
Ethyl benzene - ug/L	100.0	Annual – 4th Qtr.	Discrete
Toluene - ug/L	100.0	Annual – 4th Qtr.	Discrete
Xylene - ug/L	200.0	Annual – 4th Qtr.	Discrete
pH – SU	6.5 – 9.0	Annual – 4th Qtr.	Discrete
Total Petroleum Hydrocarbon (TPH) (C6 – C40) mg/L[3]	1.0	Annual – 4th Qtr.	Discrete

1. Samples must be collected during the first hour of discharge. For discharges that extend beyond an hour in duration, a second sample shall be collected prior to end of discharge, or as specified by the division.
2. Test results to be submitted by **Jan 28th** of the calendar year.
3. EPA Method 8015B and EPA Method 8260B, extractable and purgeable, C6-C40. Summation must meet permit limit.

A.10.3.4 Category 4 - Subsurface water discharges: Discharge Limitations, Monitoring Requirements and Conditions

Parameters	Discharge Limit - Daily Maximum	Measurement Frequency[5]	Sample Type
Flow – gallons per minute (gpm)	250	Continuous	Continuous
Total Residual Chlorine[1] - mg/L	0.10	Two/Discharge	Discrete
Total Dissolved Solids (TDS) - mg/L	Monitor & Report	Annual – 4th Qtr.	Discrete
Total Suspended Solids (TSS) - mg/L	Monitor & Report	Annual – 4th Qtr.	Discrete
Methyl tert-Butyl Ether (MTBE) - µg/L	20.0	Annual – 4th Qtr.	Discrete
Total Nitrogen as N - mg/L	10.0	Annual – 4th Qtr.	Discrete
Total Phosphorus as P	Monitor & Report	Annual – 4th Qtr.	Discrete
Trichloroethylene (TCE) - ug/L	5.0	Annual – 4th Qtr.	Discrete
Tetrachloroethylene (PCE) - ug/L	5.0	Annual – 4th Qtr.	Discrete
Benzene - ug/L	5.0	Annual – 4th Qtr.	Discrete
Ethyl benzene - ug/L	100.0	Annual – 4th Qtr.	Discrete
Toluene - ug/L	100.0	Annual – 4th Qtr.	Discrete
Xylene - ug/L	200.0	Annual – 4th Qtr.	Discrete
pH – SU	6.5 – 9.0	Annual – 4th Qtr.	Discrete
Total Petroleum Hydrocarbon (TPH) (C6 – C40) mg/L[6]	1.0	Annual – 4th Qtr.	Discrete
Barium – mg/L	2.0	Annual – 4th Qtr.	Discrete
Fluoride – mg/L	Monitor & Report	Annual – 4th Qtr.	Discrete
Iron – mg/L	1.0	Annual – 4th Qtr.	Discrete
Sulfate – mg/L	Monitor & Report	Annual – 4th Qtr.	Discrete
Molybdenum - mg/L	6.16	Annual – 4th Qtr.	Discrete
Turbidity – NTU[2, 3]	Monitor & Report	Annual – 4th Qtr.	Discrete
Fecal Coliform - MPN100 mL	Monitor & Report	Annual – 4th Qtr.	Discrete
E Coli[4] - MPN/100 mL	Monitor & Report	Annual – 4th Qtr.	Discrete
Dissolved Oxygen - mg/L	Monitor & Report	Annual – 4th Qtr.	Discrete

1. Samples must be collected during the first hour of discharge. For discharges that extend beyond an hour in duration, a second sample shall be collected prior to end of discharge, or as specified by the division.
2. BMPs shall be implemented to minimize erosion and sediment.
3. During the discharge, if a visible turbidity plume is generated, a grab sample shall be obtained. Turbidity shall be less than or equal to 10 Nephelometric Turbidity Units (NTUs) over the background value of the receiving water.
4. Single Value.
5. Test results to be submitted by **Jan 28th** of the calendar year.
6. EPA Method 8015B and EPA Method 8260B, extractable and purgeable, C6-C40. Summation must meet permit limit.

A.10.3.5 Category 5 - Utility vault water discharges: Discharge Limitations, Monitoring Requirements and Conditions

Parameters	Discharge Limit - Daily Maximum	Measurement Frequency[5]	Sample Type
Flow – gallons per minute (gpm)	250	Continuous	Continuous
Total Residual Chlorine[1] - mg/L	0.10	Two/Discharge	Discrete
Total Dissolved Solids (TDS) - mg/L	Monitor & Report	Annual – 4th Qtr.	Discrete
Total Suspended Solids (TSS) - mg/L	Monitor & Report	Annual – 4th Qtr.	Discrete
Methyl tert-Butyl Ether (MTBE) - µg/L	20.0	Annual – 4th Qtr.	Discrete
Total Nitrogen as N - mg/L	10.0	Annual – 4th Qtr.	Discrete
Total Phosphorus as P	Monitor & Report	Annual – 4th Qtr.	Discrete
Trichloroethylene (TCE) - ug/L	5.0	Annual – 4th Qtr.	Discrete
Tetrachloroethylene (PCE) - ug/L	5.0	Annual – 4th Qtr.	Discrete
Benzene - ug/L	5.0	Annual – 4th Qtr.	Discrete
Ethyl benzene - ug/L	100.0	Annual – 4th Qtr.	Discrete
Toluene - ug/L	100.0	Annual – 4th Qtr.	Discrete
Xylene - ug/L	200.0	Annual – 4th Qtr.	Discrete
pH - SU	6.5 – 9.0	Annual – 4th Qtr.	Discrete
Total Petroleum Hydrocarbon (TPH) (C6 – C40) mg/L[6]	1.0	Annual – 4th Qtr.	Discrete
Barium – mg/L	2.0	Annual – 4th Qtr.	Discrete
Fluoride – mg/L	Monitor & Report	Annual – 4th Qtr.	Discrete
Iron – mg/L	1.0	Annual – 4th Qtr.	Discrete
Sulfate – mg/L	Monitor & Report	Annual – 4th Qtr.	Discrete
Molybdenum - mg/L	6.16	Annual – 4th Qtr.	Discrete
Turbidity – NTU[2, 3]	Monitor & Report	Annual – 4th Qtr.	Discrete
Fecal Coliform - MPN100 mL	Monitor & Report	Annual – 4th Qtr.	Discrete
E Coli[4] - MPN/100 mL	Monitor & Report	Annual – 4th Qtr.	Discrete

1. Samples must be collected during the first hour of discharge. For discharges that extend beyond an hour in duration, a second sample shall be collected prior to end of discharge, or as specified by the division.
2. BMPs shall be implemented to minimize erosion and sediment.
3. During the discharge, if a visible turbidity plume is generated, a grab sample shall be obtained. Turbidity shall be less than or equal to 10 Nephelometric Turbidity Units (NTUs) over the background value of the receiving water.

4. Single Value.
5. Test results to be submitted by **Jan 28th** of the calendar year.
6. EPA Method 8015B and EPA Method 8260B, extractable and purgeable, C6-C40. Summation must meet permit limit.

A.11 MONITORING AND REPORTING:

A.11.1 Monitoring:

A.11.1.1 Representative Samples:

A.11.1.1.1 Samples and measurements taken as required herein shall be representative of the nature and volume of the monitored discharge. Analysis shall be performed by a State of Nevada certified laboratory. Results from this laboratory must accompany the Discharge Monitoring Report (DMR) Form; monitoring results shall be submitted to the address listed in I.D.9 within 30 days of the discharge, or as required.

A.11.1.1.2 Copies of sample and measurement results shall be maintained on site.

A.11.1.2 Recording the Results:

A.11.1.2.1 For each measurement or sample taken pursuant to the requirements of this General Uncontaminated Water Discharge Permit, the Permittee shall record the following information:

A.11.1.2.2 The exact place, date, and time of sampling;

A.11.1.2.3 The dates the analyses were performed;

A.11.1.2.4 The person(s) who performed the analyses;

A.11.1.2.5 The analytical techniques or methods used (list field testing equipment);

A.11.1.2.6 The results of all required analyses, including reporting limits.

A.11.1.3 Additional Monitoring by Permittee:

A.11.1.3.1 If the Permittee monitors any constituent at the location(s) designated herein more frequently than required by this general discharge permit, using approved analytical methods and laboratories as specified above, the results of that monitoring shall be included in the next annual or monitoring report submitted to the Division on the DMR form. Such increased frequency shall also be indicated on the DMR.

A.11.1.4 Annual Sampling:

A.11.1.4.1 Required sampling protocol is defined in Section C of the permit;

A.11.1.4.2 Discharge monitoring reports are due on January 28th (4th Quarter) of the calendar year as defined in Section A of the permit;

A.11.1.4.3 Additionally, the Permittee shall document and report inspection findings, update spill and unauthorized discharge information including clean up and preventive actions taken and report any modifications to the BMPs. The reports shall include all monitoring data collected, including data collected in accordance with Section C of this permit and a summary/ interpretation of that data;

A.11.1.4.4 The discharge shall not cause the following in the receiving water:

A.11.1.4.4.1 Concentrations of dissolved oxygen (DO) in the receiving water to fall below 7.0 mg/L. During any period when the receiving water DO concentration is already below 7.0 mg/L, the discharge shall not further diminish the DO content;

A.11.1.4.4.2 Alteration to the color, taste or odor beyond present natural ambient levels;

A.11.1.4.4.3 Turbidity in amounts which adversely affect beneficial uses in the receiving waters. Turbidity shall not increase more than 20 percent over background levels;

A.11.1.4.4.4 Significant erosion, sedimentation or alteration of the watercourse;

A.11.1.4.4.5 Biostimulatory substances to be present in concentrations that promote aquatic growths to the extent that such growths cause nuisance or adversely affect beneficial uses;

A.11.1.4.4.6 The normal ambient receiving water to be altered more than 5° F (Fahrenheit), if a temperature standard is present;

A.11.1.4.4.7 Further degradation of any 303d listed receiving water for an established parameter.

A.11.2 Reporting:

A.11.2.1 Annual Reports:

A.11.2.1.1 Annual reports are required for NDEP approved discharge operations as defined in Section C of the permit.

A.11.2.1.2 Annual monitoring results obtained pursuant to Section A of the permit are due each January 28th (4th Quarter) of the current calendar year. Reports shall be summarized and reported on a Discharge Monitoring Report (DMR) form. The Permittee shall also submit the data in an electronic format provided by the Division addressed in Section C below.

A.11.2.1.3 Summaries of laboratory results for analyses conducted by outside laboratories must accompany the DMR, and the full data package provided by the laboratory must be provided if requested in writing by the Division. If at any time the Permittee concludes that submitted data were incorrect, the Permittee shall notify the Division in writing, identify the incorrect data, and replace the incorrect data with corrected data, which shall thereafter be used for determining compliance with this permit

A.11.2.2 Compliance Report:

A.11.2.2.1 Reports of compliance or noncompliance with, or any progress reports on, interim and final requirements contained in any compliance schedule of this permit shall be submitted no later than 14 days following each schedule date.

A.11.3 Other information:

A.11.3.1 Where the Permittee becomes aware that it failed to submit any relevant facts in a permit application, or submitted incorrect information in a permit application or in any report to the Administrator, it shall promptly submit such facts or information.

A.12 ANNUAL FEE:

A.12.1 The Permittee shall remit an annual review and services fee in accordance with NAC 445A.268 on or before July 1st of every year that the Permittee is authorized to discharge under this General Permit.

SECTION B:

B.1 GENERAL PERMIT COVERAGE FOR ONGOING PROJECTS:

B.1.1 Current permits are valid until expiration date. To be covered by this permit, holders of an expired permit must submit a new NOI with the proper filing fee.

B.2 NARRATIVE STANDARDS:

B.2.1 Discharges shall not cause the following standards to be violated in any surface waters of the state. Waters must be free from:

B.2.1.1 Substances that will settle to form sludge or bottom deposits in amounts sufficient to be unsightly, putrescent or odorous;

B.2.1.2 Floating debris, oil, grease, scum, and other floating materials in amounts sufficient to be unsightly;

B.2.1.3 Materials in amounts sufficient to produce taste or odor in the water or detectable off-flavor in the flesh of fish or in amounts sufficient to change the existing color, turbidity or other conditions in the receiving stream to such a degree as to create a public nuisance;

B.2.1.4 High temperature, biocides, organisms pathogenic to human beings, toxic, corrosive or other deleterious substances at levels or combinations sufficient to be toxic to human, animal, plant or aquatic life;

B.2.1.5 Radioactive materials must not result in accumulations of radioactivity in plants or animals that result in a hazard to humans or harm to aquatic life;

B.2.1.6 Untreated or uncontrolled wastes or effluents that are reasonably amenable to treatment or control; and

B.2.1.7 Substances or conditions, which interfere with the beneficial use of the receiving waters.

B.2.2 The narrative standards are not considered violated when the natural conditions of the receiving water are outside the established limits, including periods of high or low flow. Where effluents are discharged to such waters, the discharges are not considered a contributor to substandard conditions provided maximum treatment in compliance with permit requirements is maintained.

B.2.3 There shall be no objectionable odors from the collection system, treatment facility or disposal area, or biosolids treatment, use, storage or disposal area that the Permittee owns or operates.

B.2.4 There shall be no discharge of substances that would cause a violation of water quality standards of the State of Nevada as defined by the permit.

B.2.5 The permit may be reopened, and additional limits imposed, if it is determined that the discharge is causing a violation of ambient water quality standards of the State of Nevada.

B.2.6 There shall be no discharge from the collection, treatment and disposal facilities except as authorized by this permit or in accordance with the Division's Spill Reporting Policy.

B.2.7 The treatment and disposal facility shall be fenced and posted.

B.2.8 There shall be no discharge of floating solids or visible foam in other than trace amounts.

B.3 BEST MANAGEMENT PRACTICES (BMP):

B.3.1 BMP's shall be implement and maintained to the Maximum Extent Practicable

B.3.2 Permittees shall implement BMPs prior to commencement of discharge.

B.3.3 A Permittee shall implement the BMP requirements to ensure compliance with the terms and conditions of this general permit.

B.3.4 The Permittee shall make all BMP records and plans available to the Division upon request.

B.3.5 All sediment control measures and other protective measures must be maintained in effective operating condition.

B.3.6 If existing BMPs need to be modified or additional BMPs are necessary, implementation must be completed as soon as possible.

B.3.7 All erosion and sediment control measures and other protective measures must be maintained in effective operating condition. If site inspections identify BMPs that are not operating effectively or if the capacity has been reduced by 50%, maintenance

shall be performed.

B.3.8 NDEP may require modifications to the site BMP's.

B.4 24 HOUR REPORTING:

B.4.1 The Permittee shall orally report any noncompliance or discharge which may seriously endanger human health or the environment as soon as possible, but no later than 24 hours from the time the Permittee becomes aware of the circumstances. The report shall be made to the Division at (888) 331-6337 during normal business hours. A written report shall also be submitted to the Division within ten days of the time the Permittee becomes aware of the circumstances. The written submission shall contain a description of the event, and its cause; the period of time over which it occurred, including exact dates and times, and if the situation has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence.

B.5 PHOTOGRAPHIC DOCUMENTATION:

B.5.1 Discharges conducted under the terms and conditions of this General Permit shall also be monitored by means of photographic documentation to verify performance of the water management BMPs and the discharge point BMPs. The photographs shall be submitted with a brief summary narrative report quarterly if conditions have changed. Photographs shall be taken from established photograph points, and shall depict representative views of the discharge activities on site, as well as the scope of operations with project sites, monitoring location(s), discharge point(s), and any relevant activity related to the discharge.

C SECTION C:

C.1 DEFINITIONS AND GENERAL REQUIREMENTS:

C.1.1 **Municipal Separate Storm Sewer Systems (MS4),** as defined in 40 CFR 122.26 (b) (8) http://edocket.access.gpo.gov/cfr_2002/julqtr/40cfr122.26.htm, is a conveyance or system of conveyances that is: Owned by a state, city, town, village, or other public entity that discharges to waters of the U.S.; Designed or used to collect or convey stormwater (including storm drains, pipes, ditches, etc.); Not a combined sewer; and Not part of a Publicly Owned Treatment Works (sewage treatment plant).

C.1.2 **Best Management Practices (BMPs**) means schedules of activities, prohibitions of practices, maintenance procedures and other management practices to prevent or reduce the pollution of Waters of the U.S. BMPs also include treatment requirements, operating procedures and practices to control site runoff, spillage, leaks, or other sources of pollution.

C.1.3 **DeMinimis discharge** means a discharge that is relatively pollutant free water which when discharged, in conjunction with appropriate BMPs that are used to reduce any and all pollutants to below the applicable limits set by this permit, has minimal or no

adverse impact to the environment or public health.

C.1.4 **Utility** means a system to provide for the distribution of water, natural gas, electricity, communications (including telephone, cellular telephone towers, and fiber optics), cable television and other such systems.

C.1.5 **Waters of the U. S**. is defined at 40 CFR §122.2, and includes but is not limited to lakes, reservoirs, ponds, rivers, streams (including intermittent and ephemeral streams), creeks, washes, draws, sloughs, playas and wetlands.

C.1.6 **303 (d) List - Nevada:** Criteria – Please see the following link: http://ndep.nv.gov/bwqp/file/303d_list09.pdf

C.1.7 **303 (d) List - Nevada:** Nevada's 303(d) List of Impaired Waters – Please see the following link: http://ndep.nv.gov/bwqp/file/303d_list09-att1.pdf

C.2 TEST PROCEDURES:

C.2.1 Test procedures for the analysis of pollutants shall conform to regulations (40 CFR, Part 136) published pursuant to Section 304(h) of the Act, under which such procedures may be required unless the Division approves other procedures. For the purpose of this permit, the Permittee may use alternate field test kits and instrumentation for field screening. Field testing is permitted, using suitable methods for flow, pH, total chlorine residual and temperature.

C.3 PLANNED CHANGES:

C.3.1 The Permittee shall give notice to the Administrator as soon as possible of any planned physical alterations or additions to the permitted facility.

C.3.2 Notice is required only when the alteration or addition to a permitted facility, may meet one of the criteria for determining whether a facility is a new source (40 CFR 122.29(b)), or could significantly change the nature or increase the quantity of pollutants discharged.

C.4 ANTICIPATED NON-COMPLIANCE:

C.4.1 The Permittee shall give advance notice to the Administrator of any planned changes in the permitted facility or activity, which may result in noncompliance with permit requirements.

C.4.2 Reports shall include a certification that the Permittee is in compliance with the permit, and identify any incidents of non-compliances; a narrative explanation must be attached to every non-compliance incident.

C.5 ADDRESS FOR SUBMITTAL:

C.5.1 All monitoring results and annual reports shall be submitted to the Division; an original signed copy of all reports required herein, shall be submitted to the Division at the following address:

Division of Environmental Protection
Bureau of Water Pollution Control
901 South Stewart Street, Suite 4001
Carson City, Nevada 89701
ATTN: Compliance Coordinator

C.6 CHANGE IN DISCHARGE:

C.6.1 All discharges authorized herein shall be consistent with the terms and conditions of this general permit. Any anticipated new discharges at the site related to the discharges as described in Section A which will result in new, different, or increased discharges of pollutants must be reported to the Division. Pursuant to NAC 445A.263, the General Permit may be modified to specify and limit any pollutants not previously limited.

C.7 OPERATION:

C.7.1 The Permittee shall at all times maintain in good working order and operate as efficiently as possible all equipment and ancillary BMPs used by the Permittee to achieve compliance with the terms and conditions of this general discharge permit.

C.8 ADVERSE IMPACT:

C.8.1 The Permittee shall take all reasonable steps to minimize any adverse impact to receiving waters resulting from noncompliance with this General Permit, including such accelerated or additional monitoring as necessary to determine the nature and impact of the noncomplying discharge. The Permittee shall carry out such measures, as reasonable, to prevent significant adverse impacts on human health or the environment.

C.9 REMOVED SUBSTANCES:

C.9.1 Solids removed during the control of discharged water shall be disposed of in a manner to prevent pollution from such materials from entering any surface or ground water.

C.10 MODIFICATION OF MONITORING FREQUENCY AND SAMPLE TYPE:

C.10.1 After considering monitoring data, discharge flow and receiving water conditions, the Division, may, for just cause, modify the monitoring frequency and/or sample type by issuing an order to the Permittee.

C.11 RECORDS RETENTION:

C.11.1 All records and information resulting from the monitoring activities required by this General Permit, including all records of analyses performed and calibration and maintenance of instrumentation and recordings from continuous monitoring instrumentation, shall be retained for a minimum of three (3) years after approval to discharge under this permit, or longer if required by the Administrator.

C.12 DETECTION LIMITS:

C.12.1 All laboratory analysis conducted in accordance with this discharge permit must meet the following criteria:

C.12.1.1 All methods used must be specified or approved in either 40 CFR 136, SW-846 or otherwise approved by the Division. All analytical results must be generated by analytical laboratories certified by the Nevada State laboratory certification program; and

C.12.1.2 Each parameter shall have detection at or below the permit limits or the Reported Detection Level as defined in the analytical method, whichever is lower.

C.13 RIGHT OF ENTRY:

C.13.1 The Permittee shall allow the Administrator and/or his authorized representatives, upon the presentation of credentials;

C.13.2 To enter upon the Permittee's premises (and other property) where a discharge occurs and/or in which any records are required to be kept under the terms and conditions of this General Permit;

C.13.3 At reasonable times, to have access to and copy any records required to be kept under the terms and conditions of this General Permit;

C.13.4 Inspect any monitoring equipment or monitoring method required in this General Permit; or,

C.13.5 Perform any necessary inspection and/or sampling to determine compliance with this General Dewatering Permit or to sample any discharge.

C.14 TRANSFER OF OWNERSHIP OR CONTROL:

C.14.1 In the event of any change in control or ownership from which the authorized discharge emanates, the Permittee shall notify the succeeding owner or controller of the existence of this General Permit, by letter, a copy of which shall be forwarded to the Administrator. The Division must approve ALL transfers of the permit.

C.15 AVAILABILITY OF REPORTS:

C.15.1 Except for data determined to be confidential under NRS 445A.665, all reports prepared in accordance with the terms of this General Permit shall be available for public inspection at the office of the Division. As required by the Clean Water Act and NRS, discharge data shall not be considered confidential. Knowingly making any false statement on any such report may result in the imposition of criminal penalties as provided for in NRS 445A.710.

C.16 FURNISHING FALSE INFORMATION AND TAMPERING WITH MONITORING DEVICES:

C.16.1 Any person who knowingly makes any false statement, representation, or certification in any application, record, report, plan or other document filed or required to be maintained by the provisions of NRS 445A.300 to 445A.730, inclusive, or by any General Permit, rule, regulation or order issued pursuant thereto, or who falsifies, tampers with or knowingly renders inaccurate any monitoring device or method required to be maintained under the provisions of NRS 445A.300 to 445A.730, inclusive, or by any General Permit, rule, regulation or order issued pursuant thereto, is guilty of a gross misdemeanor and shall be punished by a fine of not more than $10,000 or by imprisonment. This penalty is in addition to any other penalties, civil or criminal, provided pursuant to NRS 445A.300 to 445A.730 inclusive.

C.17 PENALTY FOR VIOLATION OF PERMIT CONDITIONS:

C.17.1 NRS 445A.675 provides that any person who violates a General Permit condition is subject to administrative and judicial sanctions as outlined in NRS 445A.690 through 445A.705.

C.18 PERMIT MODIFICATION, SUSPENSION OR REVOCATION:

C.18.1 After notice and opportunity for a hearing, this permit may be modified, suspended, or revoked in whole or in part during its term for cause including, but not limited to, the following:

C.18.1.1 Violation of any terms or conditions of this permit;

C.18.1.2 Obtaining this permit by misrepresentation or failure to disclose fully all relevant facts;

C.18.1.3 A change in any condition that requires either a temporary or permanent reduction or elimination of the authorized discharge;

C.18.1.4 A determination that the permitted activity endangers human health or the environment and can only be regulated to acceptable levels by permit modification or termination;

C.18.1.5 There are material and substantial alterations or additions to the permitted facility or activity;

C.18.1.6 The Administrator has received new information;

C.18.1.7 The standards or regulations have changed; or

C.18.1.8 The Administrator has received notification that the permit will be transferred.

C.19 LIABILITY:

C.19.1 Nothing in this General Permit shall be construed to preclude the institution of any legal action or relieve the Permittee from any responsibilities, liabilities, or penalties established pursuant to any applicable Federal, State or local laws, regulations, or ordinances.

C.20 PROPERTY RIGHTS:

C.20.1 The issuance of this General Permit does not convey any property rights, in either real or personal property, or any exclusive privileges, nor does it authorize any injury to private property or any invasion of personal rights, nor any infringement of Federal, State or local laws, regulations or ordinances.

C.21 SEVERABILITY:

C.21.1 The provisions of this General Permit are severable, and if any provision of this Permit, or the application of any provisions of this Permit to any circumstance, is held invalid, the application of such provision to other circumstances, and the remainder of this Permit, shall not be affected thereby.

C.22 SIGNATURES, CERTIFICATION REQUIRED ON APPLICATION AND REPORTING FORMS:

C.22.1 All applications, reports, or information submitted to the Administrator shall be signed and certified by making the following certification.

"I hereby certify that I am familiar with the information contained in the application and that to the best of my knowledge and ability such information is true, complete, and accurate."

C.22.2 All applications, reports or other information submitted to the Administrator shall be signed by one of the following:

C.22.2.1 A principal executive officer of the corporation (of at least the level of vice president) or his authorized representative who is responsible for the overall operation of the facility from which the discharge described in the application or reporting form originates;

C.22.2.2 A general partner of the partnership;

C.22.2.3 The proprietor of the sole proprietorship; or

C.22.2.4 A principal executive officer, ranking elected official or other authorized employee of the municipal, state or other public facility.

C.23 CHANGES TO AUTHORIZATION:

C.23.1 If an authorization under Section C (Signatures, Certification Required on Application and Reporting Forms) is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new authorization satisfying the requirements of Section C (Signatures, Certification Required on Application and Reporting Forms) must be submitted to the Administrator prior to or together with any reports, information, or applications to be signed by an authorized representative.

C.24 REAPPLICATION:

C.24.1 If the Permittee desires to continue to discharge, he shall reapply not later than 180 days before this permit expires on the application forms then in use. The renewal application shall be accompanied by the fee required by NAC 445A.268.

C.25 DUTY TO PROVIDE INFORMATION:

C.25.1 The Permittee shall furnish to the Administrator, within a reasonable time, any relevant information which the Administrator may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this permit, or to determine compliance with this permit. The Permittee shall also furnish to the Administrator, upon request, copies of records required to be kept by this permit.

Subject: Tt Field Activities Update 8/09 - 8/12

Good morning,

The pumping test at MW-14 area (west side of the Mall) has been successfully completed on Friday, 8/10. Approximately 4,620 gallons of groundwater was extracted and treated (during 77 hours of pumping). Site was tidied up, filter tanks drained and pumped into the Baker tank.

The test was stopped at 4 pm and the pump was pulled out at 6 pm after the water level in the pumping well EW-1 recovered. The transducers were left in all wells (MW-6, MW-13, MW-14, and EW-1) to continue water level monitoring over the weekend. After data downloading, the transducers were removed from all wells on Sunday a.m.

The test produced a good set of data, with maximum drawdowns in the pumping well of 13 feet and 0.1 to 0.23 foot in observation wells (all of which responded to pumping, including down gradient well MW-13).

The treated water in both Baker tanks (one at the eastern parking lot area and another at the MW-14 area) will be sampled today for lab analyses for PCE and total dissolved solids**.**

Hello,

As of 7 pm on Thursday about 3300 gallons was pumped out and treated. Flow rate was maintained at 1 gpm. The drawdown in the pumping well EW-1 was 12.4 feet.

On Friday at 11 a.m. it will be exactly 3 days since the start of the pumping test. We may continue pumping after 11 a.m. until drawdown in EW-1 is about 15 ft.

Hello,

Very brief update: the pumping test at MW-14 area continued; the constant rate of 1 gpm was successfully maintained.

More specifics will be provided in my next e-mail.

Regards,

Vladimir Prilepin, Ph.D., P.G. | Senior Hydrogeologist

Subject: Tt Field Activities Update 8/7

Here is the brief summary of Tuesday activities:

- Rain for Rent and Cascade installed and hooked up all the components of the groundwater treatment system at MW-14 area;
- Pressure transducers to monitor water levels during the pumping tests were installed in four wells (EW-1, MW-14, MW-6, and MW-13); the wells MW-14 and MW-6 are located cross gradient from the pumping well EW-1 at 40 and 80 feet; well MW-13 is 220 feet down gradient from EW-1.
- Long term pumping test started at 11 a.m. By 9 p.m., i.e. after 10 hours of pumping at 1 gpm, about 600 gallons of groundwater was extracted and treated. Drawdown in the pumping well was 9.8'; both wells MW-14 and MW-6 showed a measurable response to pumping. The 10th hour data suggest that well MW-13 will also respond to pumping.

The pumping will be continued for the next two days. The data will be evaluated to determine whether the pumping test should be stopped on Friday morning or continued to more than 3 days total.

Subject: Tt Field Activities Update 8/3 - 8/6

Good morning,

Pumping test at the Eastern parking lot area was completed on Saturday a.m., 8/4. During continuous pumping for 3 days at a rate of 0.94 gpm, a total of 4,061 gallons of groundwater was extracted and treated. Sufficient water level data was collected for interpretation of test results.

On Monday, 8/6 a step-test was completed at MW-14 area (west side of the Mall). The step test was run at progressively increasing rates (1, 1.5, and 2 gpm). The results of the step test indicate that a sustainable pumping rate for this area will be about 1 gpm.

Water (136 gallons) extracted during the step test was temporarily stored in the poly tank. Once all the equipment of the groundwater treatment system is installed (before the Mall hours on Tuesday), the extracted water will be pumped through the system for treatment.

The plan for Tuesday is to begin the long-term pumping test at MW-14 area.

Subject: Tt Field Activities Update 8/2

Good morning,

Pumping test at the Eastern parking lot area continued on Thursday and through the night. As of 10 pm of 8/3/12 (after 36 hours of pumping), 2080 gallons of contaminated groundwater was extracted and treated.

Drawdown in the pumping well (EW-2) was slightly increasing over time, currently is 3.86 ft. The response of the nearby observation well is still pretty weak (few hundreds of a foot).

The plan for Friday and Friday night is to continue pumping and monitor water levels in the nearby observation wells.

Hello,

The pumping test is running smoothly since 9:20 a.m. Based on the step test, well performs most efficiently at a flow rate of 0.9 gallons per minute. This rate was used for the ongoing constant rate pumping test.

As of 10 pm, i.e. after 12 hours 40 minutes of continuous pumping the drawdown in the pumping well (EW-2) is 3.6 ft. The drawdown stabilized within the first couple of hours into the test at ~ 3.3; it was very slowly increasing thereafter. A total of 709 gallons of water was extracted and treated for PCE and total dissolved solids.

Cascade crew member is at the site through the night to monitor flow rate and water levels in EW-2 and nearby observation wells.

The plan for Thursday is to continue pumping and monitor water levels.

Subject: Tt Field Activities Update 7/31

Hello,

On Tuesday, we completed a 1.5 hour step test and also monitored for water level recovery.

Relatively low permeable materials predominate in the saturated zone at location of wells EW-2 (pumping well), so this well is capable of producing 1.5 gpm.

We tried three 0.5 hour steps with each of flow rates: 0.9, 1.2, and 1.4 gpm. During the last step we drew water level to below the top of the screen interval. The total drawdown was ~10 feet.

The plan for tomorrow is start the constant rate pumping test. We'll use the lowest possible rate (close to 1 gpm). Considering the tightness of formation, it's unlikely we'll be able to pump continuously for 3 days. We'll be lucky to run the test for a day.

We have a better chance of running a longer pumping test on the west side of the Mall

Subject: Tt Field Activities Update 7/28 - 7/30

Good evening,

Here a list of field activities over the weekend and on Monday, July 30:

- West side of the mall: well EW-1 had been developed on Saturday
- Well development water has been moved off-site
- Eastern Parking Lot Area: equipment for the groundwater treatment system (GTS) was installed Monday morning. The GTS includes 4 bag filters, the carbon vessel (for treatment of volatile organic compounds], and an ion-exchange vessel with resin (for treatment of TDS)]. The treated water will go to the 20,000 gal tank. There are also two spill containment areas for 2,000 gal (around treatment units) and 5,000 gal (around the tank).

The Cascade crew is arriving around 10 a.m. to set up the pump into the well and connect the discharge pipe to the GTS. Pressure transducers will be installed in several wells to measure change in water levels during the tests. The plan is to conduct step-rate test on Tuesday, let water level recover to within 90-95% of static (prior to the test), and after the sustainable rate if determined begin the long term constant rate pumping test.

Good afternoon,

During Thursday and the night from Thursday to Friday:

- Eastern parking lot area (during the day) – Developed well EW-2. Only shallow interval could be developed for well MW-40 with a peristaltic pump. Cascade is looking for ways to develop deeper intervals;
- West side of the Mall (after 9 pm and through the night) – Completed well EW-1 construction; this well is ready to be developed on Saturday;
- Removed 2 drums with soil cuttings and 4 drums with water (decon and development) off-site;
- Demobilized the rig and other drilling equipment off-site.

The plan for Monday, July 30th is to (1) set up all the equipment for the first pumping test in the Eastern parking lot area; (2) install pressure transducers into the pumping well and observation wells for background water level measurements. If all the equipment is in place and hooked up by noon, it will be possible to conduct the first phase of pumping test (step test) in the p.m. The 72-hour pumping test will be conducted next, after water levels recovered (likely on Tuesday).

Best regards,

Subject: Tt Field Activities Update for 7/25 - 7/26

Hello,

During the night of Wednesday to Thursday:

- Drilled/logged/sampled borehole EW-1 (west of the Mall) down to 55 feet below ground surface. Boring terminated as competent clay was encountered.
- Collected 5 depth discrete groundwater samples
- Collected one undisturbed sample for physical analyses
- Began development of EW-2 (eastern parking lot area) this morning. It may take up to 4 hours to do cycles of surging and bailing, and then pumping until water quality parameters stabilized. According to Dale Emerson (Cascade's well developer, EW-2 recharges quickly).
- Yesterday and this morning 6 drums with soil cuttings and decon water were removed from working areas to the designated storage area.

We will start installing well EW-1 tonight at 9 pm after the team gets some sleep.

Best regards,

Vladimir Prilepin, Ph.D., P.G. | Senior Hydrogeologist

Subject: Tt Field Update for 7/25 a.m.

Hello,

This morning field activities in the Eastern Parking lot area included:

- Grouting and surface completion of the CMT well MW-40;
- Removal of 3 drums (2 with decon water and 1 with soil cuttings) to a designated storage area;
- Initial cleanup of the asphalt surfaces around the boring locations.

Locked the gate at 11 a.m. The team is taking a break until we meet at 8:30 p.m. to get ready for night work in the MW-14 area (west of the Mall). The plan is to do air-knifing clearance of the borehole location down to 5 feet and then proceed with drilling/sampling EW-1.

Subject: 7/24 field activities

A quick update for Tuesday:

- Completed drilling of MW-40 from 40 to 60' bgs;
- Collected 5 depth discrete gw samples (7 altogether from this well), the deepest one was at 60-61' bgs;
- Installed continuous multi-channel tubing (CMT) well (with 7 well screens placed every 5 feet from 30 to 60.5' bgs); placed filter pack sand around each screen and transition sand, bentonite seal between adjacent screens (to isolate aquifer zones to be monitored). It took about 4.5 hours to install CMT well (without grouting and surface completion);
- Shipped soil samples (PNOD and geophysical parameters) to respective labs; gw samples were picked up by the ATL.

- We didn't have time to grout the borehole up (along the blank casing) as we had to move drums with soil cuttings and decon water offsite. We'll finish the well in the a.m. Wednesday, the team will then take a break until evening when we start working on the last borehole (EW-1), west side of the Mall. It is possible that we'll drill/sample EW-1 Wednesday night and complete well installation on Thursday night.

Subject: Tt Field activities update for 1/8/13

Hello Team,

Today's field activities in the Eastern Parking lot area included:

- Securing the fence (Cascade installed it on Monday, 1/7/13)
- Resurveying (clearance) of MW-19D location using GPR – it was marked nearly 30 feet away from MW-19
- Clearance of both MW-20D and MW-19D with air vac tool down to 5 feet bgs
- Drilled MW-20D down to 30 feet bgs [started drilling at 14:15, in 45 minutes or so went to 30'; harder drilling was at 9-11.5' and 24-26' where caliche and caliche-like layers were encountered; first saturated zone was encountered at ~ 23' bgs, likely perched gw atop of the caliche-like layer; the materials below the caliche-like layer <gravelly clay, gravel/clay mixture> appeared relatively dry; depth to water was later tagged at ~ 26' bgs]
- Assembled the simul-probe tool to collect first gw sample in the a.m. on Wednesday, 1/9/13

The plan for 1/9/13 is to continue drilling MW-20D to a total depth of 100' and collecting grab gw samples every 10 feet starting from below the water table.

Subject: Tt Field activities update for 1/9/13

Groundwater sampling slowed us down today. We attempted to collect gw samples at 27' and 37' bgs, but the sampler came back empty. Testing the sampler and driving in the 10" and then 8" conductor casings also took time. We drilled down to 55' bgs (i.e. only 25 feet today), then installed SimulProbe sampler down to 56.5' bgs and left it overnight.

If SimulProbe sampler comes empty in the a.m. Thursday we'll have to switch to Hydropunch Type 2 technology (after consulting with NDEP). This technology for depth-discrete gw sampling worked fine for us last summer.

I'm attaching a couple of pictures. Let me know if you have questions. Thanks,

Vladimir Prilepin, Ph.D., P.G. | Senior Hydrogeologist

Cc: Bradley, Steve
Subject: Tt Field activities update for 1/10/13

Here is a list of today's accomplishments:

- Collected first gw sample with SimulProbe at ~ 56 feet bgs (the sampler was left in place overnight from the previous day).
- Attempted to collect gw samples at 66 and 86 feet bgs (after waiting for an hour each), but the sampler came out with insufficient amount of water.
- Didn't attempt collect samples at 76 and 96 feet bgs as we encountered lean or stiff clay at these intervals, so proceeded with drilling
- Below approximately 96 feet bgs silty sand was encountered, so drilled to a total depth of 100 feet bgs and installed SimulProbe at ~ 101 feet bgs and let it stay overnight. Plan to collect water sample on 1/11/13.

  If a sufficient volume for gw sample is NOT collected (3 vials 250 mL each), then we'll definitely recommend switching to Hydropunch type 2 technology.
- Drilled to a total depth of 100 feet bgs; encountered competent clay layer between 65 and 81 feet bgs.

  If this layer is laterally extensive (i.e. continues west and east of the site, that it may be a good news for the site.

The plan for tomorrow is to install a triple-nested well with the following screen intervals (based on the observed relatively more permeable materials):

MW-20D1	30-45 feet bgs
MW-20D2	55-65 feet bgs
MW-20D3	90-100 feet bgs

Please see a couple of pictures. Let me know if you have questions.

Thanks,

RE: Short-Term UIC General Permit GU07RS-52020
Maryland Square PCE Site, Las Vegas, Nevada

Dear Mr. Engel:

The Nevada Division of Environmental Protection (NDEP) has reviewed your request for minor modification of the short-term remediation underground injection control (UIC) General Permit GU07RS for the remediation activities identified in the UIC application and modification request letter. Authorization for an increase in injection rate of potassium permanganate from 10 gpm to 20 gpm is granted. Injection pressures shall be increased incrementally to ensure that fracture pressures are not reached.

Please note the following Sections of the permit:

1. The issue date of permit is March 8, 2013, and **expires September 7, 2013**;
2. I.A.1 – Authorized injectate is identified on the cover of the permit;
3. I.A.3 Reporting – monitoring reports are not required for the UIC general permit for short-term remediation. All requirements in this permit will be summarized and reported in the Corrective Action Workplan reports to Bureau of Corrective Actions.

If you have any questions or comments, please contact me at (775) 687-9502 or jferrin@ndep.nv.gov.

Sincerely,

Jason Ferrin

NEVADA DIVISION OF ENVIRONMENTAL PROTECTION

UIC GENERAL PERMIT GU07RS ID# 52020

SHORT TERM REMEDIATION – Six months or less

AUTHORIZATION TO INJECT

In compliance with the provisions of the Nevada Revised Statutes (NRS) and the Nevada Underground Injection Control (UIC) Regulations, Nevada Administrative Code (NAC) 445A.810 through 445A.925, eligible applicants are authorized to inject the following compounds and/or water from a treatment facility operated in conjunction with a Corrective Action (CA) project overseen by the Nevada Division of Environmental Protection Bureau of Corrective Actions or other CA agency into Class V injection wells in accordance with limitations, requirements and other conditions set forth in Parts I and II hereof.

This General Permit is for Corrective Action (remediation) projects lasting **six months or less** and allows injection of 1) those materials identified below in Category 1; and/or 2) water which has been treated to meet groundwater quality criteria.

Facility/Site Name: Maryland Square PCE Site

Facility Address: 3528 South Maryland Parkway, Las Vegas, Nevada 89169

Legal Description: T. 21S, R. 61E, Sec. 14

Well Owner Name: Maryland Square Shopping Center LLC/ Herman Kishner Trust

Address: 700 Pont Chartrain Drive, Las Vegas, NV 89145 Facility CA ID: H-000086

Operator Name & Address: Tetra Tech Inc., 1230 Columbia St. Suite 750, San Diego, CA

Authorized injection wells: Two (2). Well OS-1 and temporary injection point between MW-19 and MW-19I

Authorized rates/volumes: Max. of 20 gallons/day/well of H_2O_2 (34%); max. of 25 pounds of ozone; one time injection of 2% Potassium Permanganate at up to 20 gpm. Injection pressures shall remain below fracture pressure.

Required for Quarterly sampling: ☒ Per approved State or County Corrective Action Workplan

☒ See UIC permit issuance cover letter Approved plan date: February 2011

☐ Additional UIC Sampling required: _____

Coverage under this general permit will be authorized if a Notice of Intent (NOI) is submitted and the following injection occurs at a specific site:

CATEGORY 1 - One of the following is injected:

- X Low-percentage solution of hydrogen peroxide (H_2O_2);
- X Potassium and sodium permanganate;
- X Ozone;
- ☐ Oxygen infusers (note: direct oxygen injection – no infuser);
- ☐ Carbon sources/electron donors (including, but not limited to acetate, lactate, glucose, and complex sugars);
- ☐ Surfactant;
- ☐ Sulfate or Polysulfide;
- ☐ Nutrients: nitrate, ammonia, phosphate, vitamins;
- ☐ Hydrogen releasing compounds;
- ☐ Chemical oxidation compounds

CATEGORY 2 - Injection of water that has been treated to meet groundwater quality criteria.

Modifications to the above requirements must be pre-approved by the UIC Program pursuant to Part I.A.8. The Permittee shall comply with all provisions of this permit and any letter of authorization issued pursuant to it.

This general permit was issued on **October 10, 2012**. This general permit shall expire on: **October 9, 2017** Effective date for the project above is: **March 8, 2013.** The authorization issued under this permit shall expire at midnight 180 days from the effective date.

Jason Ferrin

Modified and signed this 14th day of March, 2013.

Inspector Signature — Date: 4/5/13

*** This Permit must be posted on-site and a set of approved plans, signed by CCFD Fire Prevention Bureau, available for inspection at all times. ***

RENEWABLE PERMIT CUSTOMERS: You are responsible for ensuring the renewal of said Permit 30 days prior to expiration. If you have not received a renewal notice from CCFD Fire Prevention Bureau, you may contact our Plan Intake Staff at Permits@ClarkCountyNV.gov or by calling 702-455-7122.

This Permit is issued and accepted on condition that all applicable ordinances and regulations now adopted, or that hereafter be adopted, shall be complied with, and on the additional condition that the permittee shall comply with any and all further rules and regulations which the CCFD Fire Prevention Bureau shall, from time to time impose. This Permit does not take the place of any license required by law and is not transferable. Any alterations to the fire protection systems, or changes in the use/occupancy or ownership of premises, shall void this Permit and require a new plan.

COMMENTS/CONDITIONS:
3/27/13 Approved for the use of an ozone generator capable of producing 25 lb/day ozone. This unit will be used at an outdoor soil remediation project. The unit will shut down if ozone is detected outside the generator of injection well. Per section 3704.3.2.1.1 the generator shall not be located within 75 feet of a lot line, public street, public alley public way exit discharge or a building. The perimeter fencing will be routinely checked for ozone at or above the OSHA PEL limit of 0.1 ppm. All entrances to the fence enclosure containing the generator will be placarded for Ozone.
Also approved for the storage/use of 1100 gallons of 34% (Class II oxidizer) hydrogen peroxide. This tank will also be outdoors and will be placarded and placed at least 35 feet from other exposures and occupied areas (Table 4004.1.2).

RENEWABLE PERMIT CUSTOMERS: You are responsible for ensuring the renewal of said Permit 30 days prior to expiration. If you have not received a renewal notice from Clark County Fire Department, you may contact our Plan Intake Staff at Permits@ClarkCountyNV.gov or by calling 702-455-7122.

This Permit is issued and accepted on condition that all applicable ordinances and regulations now adopted, or that hereafter be adopted, shall be complied with, and on the additional condition that the permittee shall comply with any and all further rules and regulations which the Clark County Fire Prevention Division shall, from time to time impose. This Permit does not take the place of any license required by law and is not transferable. Any alterations to the fire protection systems, or changes in the use/occupancy or ownership of premises, shall void this Permit and require a new plan.

COMMENTS/CONDITIONS:
2/28/13 Plans approved for the temporary storage/use of 3,500 pounds of a class II oxidizer (Potassium Permanganate). The storage of potassium permaganate is in 5 gallon size containers (approximately 50 pounds per container)and is stored outdoors a minimum of 35 feet from buildings, public streets, property lines, parking and from incompatible materials (such as combustible materials).
NOTE: The potassium permaganate is to be diluted down to a 2% in water and then that solution is injected into wells for treating underground soil and groundwater contaminated with TCE. The 2% solution of potassium permaganate is classified as an irritant and is not regulated by the fire code.

RE: Temporary Hazardous Materials Permit, 3528/3661 South Maryland Parkway, Las Vegas, NV

To Whom It May Concern:

Please find the attached Temporary Permit Application (3 copies), maps (3 copies) and one copy of our Site Health and Safety Plan for your review and approval.

Below is a description of the process we intend to perform at the Boulevard Mall.

Process and Storage:

Cascade Drilling will receive approximately 3,500 lbs of solid Potassium Permanganate in containers of approximately 5 gallons in size, weighing approximately 50 lbs each. Potassium Permanganate is a class II oxidizer. Cascade Drilling will keep this material 35 feet from all buildings, sources of combustible material, public streets, the property line and will utilize fencing to keep the public from parking within 35 feet of the material.

Cascade Drilling will dilute the material with water in tanks ranging in size up to 1000 gallons down to a 2% solution by weight. The solution will then be injected into the injection well to treat PCE contamination in the groundwater. It is estimated that approximately 20,000 gallons of water solution will be injected over a 3 week period.

We are requesting the permit for the storage and handling of the 3,500 lbs of potassium permanganate solids. As a 2% solution, based on our discussion with your office, it would only be an irritant, and thus not regulated under this permit.

If you have any questions, please do not hesitate to contact me at 415-302-1231 or by email at aamort@cascadedrilling.com

Sincerely,

Alexander Amort
Director Compliance and Safety
Cascade Drilling, LP

NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM PERMIT

NVG201000

In compliance with the provisions of the Clean Water Act (33 U.S.C. 1251 et. Seq. the "Act") and the Nevada Revised Statutes (Chapter NRS 445A), eligible dischargers who have submitted a Notice of Intent (NOI) and filing fee in accordance with Nevada Administrative Code (NAC) 445A.268, are authorized to discharge

DeMinimis discharges as defined in this permit

To :

Waters of the United States

In accordance with conditions set forth in Parts A, B and C hereof,

This permit became effective on February 11th, 2011.

This permit was modified and shall become effective on July 30th, 2012.

This permit and authorization to discharge shall expire at Midnight, February 11, 2016

Signed this 8th day of August, 2012

Alexi Lanza, P. E.
Bureau of Water Pollution Control
Nevada Division of Environmental Protection

A PART I - GENERAL PERMIT CONDITIONS

A.1 PERMIT OBJECTIVE:

A.1.1 GNV201000 is for DeMinimis discharges as defined below and may be intermittent or continuous. Its purpose is to provide timely authorization for discharges to Waters of the United States. This general permit establishes Notice of Intent (NOI) requirements, water quality limitations, prohibitions and management practices for five (5) separate discharge categories. For each discharge, a separate permit is required.

A.2 PERMIT COVERAGE:

A.2.1 This General Permit covers the State of Nevada.

A.3 **DISCHARGE CATEGORIES**: Category 1is hereby established as DeMinimis and shall report the duration and quantity in accordance with Section A.9.1.1. Category 2 is hereby established as DeMinimis and up to 1500 gallons per minute (gpm). Categories 3, 4, and 5 are hereby established as DeMinimis and shall be less than 250 gallons per minute (gpm):

A.3.1 **Category 1 – Public Water System (NRS 445A.235) Emergency discharges** – Permitted Public Water System Emergency discharges are a situations which pose an immediate risk to health, life, property or environment.

A.3.2 **Category 2 – Existing Public Water System supply discharges -** Permitted activities include discharges related to construction, maintenance, and testing (quantity, duration and capacity) of a public water system up to 1500 gpm (including the pipes, tanks, and reservoirs) such as:

A.3.2.1 Disinfection and flushing activities;

A.3.2.2 Discharges resulting from pressure releases, or overflows;

A.3.2.3 Discharge from wells and storage reservoirs;

A.3.2.4 Drilling of **NEW** Public Water System wells; or,

A.3.2.5 Public Water System discharges from other devices.

A.3.3 **Category 3 - Well development, testing & maintenance / aquifer testing / water quality testing -** Permitted discharges include discharges of water associated with:

A.3.3.1 Drilling of **NEW** wells (excluding Public Water System wells);

A.3.3.2 Rehabilitation or maintenance of water or geothermal wells, piezometers, and boreholes;

A.3.3.3 Water supply quantity or quality evaluations;

A.3.3.4 Well/aquifer test pumping and/or purging;

A.3.3.5 Discharges from any borehole not fully developed.

A.3.4 **Category 4 - Subsurface water discharges** - Permitted discharges include:

A.3.4.1 Groundwater from foundation, footer drain, basement, underground structure or other dewatering, provided the discharge is not contaminated with pollutants, chemicals or co-mingled with other wastewaters;

A.3.4.2 Water from intercepted or pumped groundwater.

A.3.5 **Category 5 - Utility vault water discharges** - Permitted discharges include:

A.3.5.1 Groundwater or surface water collected in vaults;

A.3.5.2 Water from subterranean seepage;

A.3.5.3 Snow melt, storm water, or water present as a result of inclement weather.

A.4 **PROHIBITED DISCHARGES:** Discharges not covered by this permit include:

A.4.1 Discharges in excess of 250 gpm, except as defined in Categories 1 and 2 (above);

A.4.2 Category 3. Category 4, or Category 5 type discharges that are within the BMI Complex as defined in Attachment I;

A.4.3 Discharges that are subject to effluent limitation guidelines at 40 CFR Part 440;

A.4.4 Discharges near or adjacent to hazardous waste sites, remediation sites, or where discharge activities may encounter naturally occurring constituents that would cause a violation of Water Quality Standards;

A.4.5 Subsurface (tile) drainage systems(or equivalent);

A.4.6 Discharges from mining activities;

A.4.7 Leaking chemical and fuel tanks;

A.4.8 Discharge of industrial waste;

A.4.9 Discharge of domestic/sanitary waste;

A.4.10 Biohazardous waste (e.g. wastes from hospitals, dentists, and/or veterinary clinics);

A.4.11 Discharges authorized by other NDEP permits;

A.4.12 Discharges that are not in conformance with an approved Total Maximum Daily Load

(TMDL);

A.4.13 Discharges into impaired waters on the Federal Clean Water Act Section 303(d) list, unless the discharge does not contain the pollutant for which the waterbody is impaired, or does not cause or contribute to an exceedance of water quality standards; or that there are sufficient remaining wasteload allocations in an EPA approved or established TMDL to allow the discharge.

A.4.14 Discharges from vehicle or equipment washing or maintenance activities including mobile washes (e.g. car, carpet, animal, and heavy equipment);

A.4.15 Underground injection control (UIC) activities;

A.4.16 Continuous discharges from existing geothermal wells or sources;

A.4.17 Working in Waters of the U.S.; or,

A.4.18 Discharges not authorized under this permit.

A.5 ELIGIBILITY, PERMIT REQUIREMENT, AND REQUEST FOR INCLUSION

A.5.1 All facilities or persons who are planning on conducting any discharge activities described in Section A.1 are eligible for this general permit.

A.5.2 Existing dischargers who are covered under a current Permit may continue to discharge until such valid permit expires.

A.5.3 The Division may require the holder of this General Permit apply for and obtain an individual permit in accordance with NRS 445A.480

A.5.4 Water quality standards included in this permit are promulgated by the Nevada Division of Environmental Protection (NDEP); current toxicity standards are defined in **NAC 445A.1236** – Standards for toxic materials applicable to designated waters.

A.5.5 New water quality standards for chlorine, toluene, ethylbenzene, *escherichia coli (*e. coli) and fecal coliform are being considered by NDEP. If adopted, these new standards may be included in general permit NVG201000 as a "minor permit modification".

A.5.6 To apply for permit coverage all new qualifying dischargers must request inclusion under this permit by completing and submitting an approved NDEP Notice of Intent (NOI) application to the Division along with appropriate permit fees. **The NOI submittal shall be submitted through NDEP's online permitting system at** http://ndep.nv.gov/bwpc/.

A.6 NOI REQUIREMENTS:

A.6.1 The minimum information required on a NOI consists of the following:

A.6.1.1 Applicant Information:

A.6.1.1.1 Applicant Name, Phone, Address, City, State, and Zip Code.

A.6.1.2 Operator Information:

A.6.1.2.1 Operator Name, Phone, Address, City, State, and Zip Code.

A.6.1.3 Billing Information:

A.6.1.3.1 Billing Name, Phone, Address, City, State, and Zip Code.

A.6.1.4 Site Information:

A.6.1.4.1 Project Name, Address, City, State, Zip Code;

A.6.1.4.2 Discharge latitude and longitude; and,

A.6.1.4.3 Scaled Site location Map showing the path from the initial outfall to the point of discharge to the receiving water.

A.6.1.5 Discharge Information:

A.6.1.5.1 Estimated Start Date;

A.6.1.5.2 Estimated Completion Date;

A.6.1.5.3 Name of the Receiving Water

A.6.1.5.4 Estimated daily flow rate;

A.6.1.5.5 Category of Discharge the permittee is requesting; and,

A.6.1.5.6 Water quality results as required by the Applicable NOI submittal requirements in Section A, below.

A.7 CERTIFICATION:

A.7.1 A signed and dated NOI Certification statement in accordance with Section C of this permit (SIGNATURES, CERTIFICATION REQUIRED ON APPLICATION AND REPORTING FORMS)

A.7.2 If water discharge (disposal) is to property other than the Permittee's, a letter of authorization (from the property owner where the discharge is to occur that explicitly allows the discharge to occur) must be included with the NOI.

A.8 NOTICE OF TERMINATION (NOT) REQUIREMENTS:

A.8.1 An approved NDEP Notice of Termination (NOT) shall be submitted upon cessation of

discharge. NOT applications are available online at http://ndep.nv.gov/bwpc/.

A.8.2 The minimum information required on a NOT consists of the following:

A.8.2.1 General Permit and authorization number;

A.8.2.2 Discharge Operator / Permittee / Applicant information: name, address, city, county, state, zip code, and phone;

A.8.2.3 Project (Site) location information: project name, project address, city, county, state, zip code;

A.8.3 A signed and dated NOT Certification statement in accordance with Section C of this permit (SIGNATURES, CERTIFICATION REQUIRED ON APPLICATION AND REPORTING FORMS)

A.9 **DISCHARGE NOI REQUIREMENTS:**

A.9.1 Based on the Category of Discharge, the following parameters must be sampled and submitted with the permit NOI:

A.9.1.1 **Category 1 – Public Water System Emergency Discharges: NOI Requirements**

A.9.1.1.1 For each Public Water System Emergency Discharge, the permittee shall provide a draft narrative report that describes the location of the discharge;

A.9.1.1.2 The estimated duration of the discharge;

A.9.1.1.3 Estimated Quantity of discharge; and,

A.9.1.1.4 A description of where the discharge entered the Municipal Storm Sewer System (MS4) and/or the associated receiving water.

A.9.1.2 **Category 2 – Public Water System Supply discharges: Supplemental Application and NOI Sampling Requirements**

A.9.1.2.1 For each New Well discharge, the permittee shall provide a draft narrative report that describes:

A.9.1.2.1.1 The location of the discharge;

A.9.1.2.1.2 The estimated duration of the discharge;

A.9.1.2.1.3 Estimated Quantity of discharge;

A.9.1.2.1.4 A description of the BMP's implemented to control drilling fluids, mud or material; and,

A.9.1.2.1.5 A representative water quality sample of the discharge.

A.9.1.2.2 For discharges in this category not associated with New well development, or where disinfection with chlorine based compounds were used, samples must be taken and submitted in accordance with the table below

Parameters	Discharge Limit - Daily Maximum	Measurement Frequency	Sample Type
Total Residual Chlorine[1] – mg/L	0.10	With NOI	Discrete
Total Dissolved Solids[2] (TDS) – mg/L	Monitor & Report	With NOI	Discrete
Turbidity – NTU [2, 3]	Monitor & Report	With NOI	Discrete

1. Only if disinfection with chlorine based compounds were carried out. Samples must be collected during the first hour of discharge. For discharges that extend beyond an hour in duration, a second sample shall be collected prior to end of discharge, or as specified by the division.
2. BMPs shall be implemented to minimize erosion and sediment.
3. During the discharge, if a visible turbidity plume is generated, a grab sample shall be obtained. Turbidity shall be less than or equal to 10 Nephelometric Turbidity Units (NTUs) over the background value of the receiving water.

A.9.1.3 Category 3 - Well development, testing & maintenance / aquifer testing / water quality testing: Supplemental Application and NOI Sampling Requirements

A.9.1.3.1 For each New Well development discharge, the permittee shall provide a draft narrative report that describes:

A.9.1.3.1.1 The location of the discharge;

A.9.1.3.1.2 The estimated duration of the discharge;

A.9.1.3.1.3 Estimated Quantity of discharge;

A.9.1.3.1.4 A description of the BMP's implemented to control drilling fluids, mud or material; and,

A.9.1.3.1.5 A representative water quality sample of the groundwater.

A.9.1.3.2 For discharges not associated with New well development, or where disinfection with chlorine based compounds were used, samples shall be taken and submitted in accordance with the table below.

Parameters	Discharge Limit - Daily Maximum	Measurement Frequency	Sample Type
Total Residual Chlorine[1] – mg/L	0.10	With NOI	Discrete
Total Dissolved Solids (TDS) – mg/L	Monitor & Report	With NOI	Discrete
Total Suspended Solids (TSS) – mg/L	Monitor & Report	With NOI	Discrete
Total Petroleum Hydrocarbon (TPH) (C6 – C40) – mg/L[5]	1.0	With NOI	Discrete

Fecal Coliform - MPN100 mL	Monitor & Report	With NOI	Discrete
E Coli[4] - MPN/100mL	Monitor & Report	With NOI	Discrete
Hardness (expressed as $CaCO_3$) - mg/L	Monitor & Report	With NOI	Discrete

1. Samples must be collected during the first hour of discharge. For discharges that extend beyond an hour in duration, a second sample shall be collected prior to end of discharge, or as specified by the division.
2. BMPs shall be implemented to minimize erosion and sediment.
3. During the discharge, if a visible turbidity plume is generated, a grab sample shall be obtained. Turbidity shall be less than or equal to 10 Nephelometric Turbidity Units (NTUs) over the background value of the receiving water.
4. Single Value.
5. EPA Method 8015B and EPA Method 8260B, extractable and purgeable, C6-C40. Summation must meet permit limit.

A.9.1.4 Category 4 - Subsurface water discharges: NOI Sampling Requirements

Parameters	Discharge Limit Daily Maximum	Measurement Frequency	Sample Type
Total Residual Chlorine[1] – mg/L	0.10	With NOI	Discrete
Total Dissolved Solids (TDS) – mg/L	Monitor & Report	With NOI	Discrete
Total Suspended Solids (TSS) – mg/L	Monitor & Report	With NOI	Discrete
Total Petroleum Hydrocarbon (TPH) (C6 – C40) – mg/L[5]	1.0	With NOI	Discrete
Methyl tert-Butyl Ether (MTBE) - µg/L	20.0	With NOI	Discrete
Total Nitrogen as N – mg/L	10.0	With NOI	Discrete
Total Phosphorus as P – mg/L	Monitor & Report	With NOI	Discrete
Trichloroethylene (TCE) - µg/L	5.0	With NOI	Discrete
Tetrachloroethylene (PCE) - µg/L	5.0	With NOI	Discrete

Benzene - µg/L	5.0	With NOI	Discrete
Ethyl benzene - µg/L	100	With NOI	Discrete
Toluene - µg/L	100	With NOI	Discrete
Xylene - µg/L	200	With NOI	Discrete

Hardness (expressed as $CaCO_3$) - mg/L	Monitor & Report	With NOI	Discrete

1. Samples must be collected during the first hour of discharge. For discharges that extend beyond an hour in duration, a second sample shall be collected prior to end of discharge, or as specified by the division.
2. BMPs shall be implemented to minimize erosion and sediment.
3. During the discharge, if a visible turbidity plume is generated, a grab sample shall be obtained. Turbidity shall be less than or equal to 10 Nephelometric Turbidity Units (NTUs) over the background value of the receiving water.
4. Single Value.
5. EPA Method 8015B and EPA Method 8260B, extractable and purgeable, C6-C40. Summation must meet permit limit.

A.10 DISCHARGE LIMITATIONS, MONITORING REQUIREMENTS AND CONDITIONS:

A.10.1 Samples taken in compliance with the monitoring requirements specified below shall be taken prior to discharge into the receiving water.

A.10.2 The discharge sample must be collected from an approved sampling location or taken from the end of the discharge pipe following the final treatment component of the system including BMPs.

A.10.3 During the period beginning on the effective date of this General Permit, and lasting until the General Permit expires, discharge activities shall be limited and, as applicable, monitored by the Permittee as specified by the tables in this section below.

A.10.3.1 Category 1 – Public Water System Emergency Discharges: Discharge Limitations, Monitoring Requirements and Conditions

A.10.3.1.1 For each Public Water System Emergency Discharge the permittee shall provide a Final narrative report that describes the location of the discharge;

A.10.3.1.2 The duration of the discharge;

A.10.3.1.3 Estimated Quantity of discharge;

A.10.3.1.4 A description of where the discharge entered the Municipal Storm Sewer System (MS4) and the associated receiving water;

A.10.3.1.5 A description of how the emergency event occurred;

A.10.3.1.6 A description of the corrective action to discontinue the discharge and the repair plan that was implemented;

A.10.3.1.7 Where applicable, a description of action taken to prevent a future discharge at the same location; and

A.10.3.1.8 A description of any environmental impacts that may have occurred as a result of the discharge.

A.10.3.2 Category 2 – Public Water System Supply discharges: Discharge Limitations, Monitoring Requirements and Conditions

Parameters	Discharge Limit Daily Maximum	Measurement Frequency[2]	Sample Type
Flow – gallons per minute (gpm)	1500	Continuous	Continuous
Total Residual Chlorine[1] - mg/L	0.10	Two/Discharge	Discrete
Total Dissolved Solids (TDS) - mg/L	Monitor & Report	Annual – 4th Qtr.	Discrete

1. Samples must be collected during the first hour of discharge. For discharges that extend beyond an hour in duration, a second sample shall be collected prior to end of discharge, or as specified by the division.
2. Test results to be submitted by **Jan 28th** of the calendar year.

A.10.3.3 Category 3 - Well testing and maintenance / aquifer testing / water quality testing: Discharge Limitations, Monitoring Requirements and Conditions

Parameters	Discharge Limit Daily Maximum	Measurement Frequency[2]	Sample Type
Flow – gallons per minute (gpm)	250	Continuous	Continuous
Total Residual Chlorine[1] - mg/L	0.10	Two/Discharge	Discrete
Total Dissolved Solids (TDS) - mg/L	Monitor & Report	Annual – 4th Qtr.	Discrete
Total Suspended Solids (TSS) - mg/L	Monitor & Report	Annual – 4th Qtr.	Discrete
Methyl tert-Butyl Ether (MTBE) - µg/L	20.0	Annual – 4th Qtr.	Discrete
Total Nitrogen as N - mg/L	10.0	Annual – 4th Qtr.	Discrete
Total Phosphorus as P	Monitor & Report	Annual – 4th Qtr.	Discrete
Trichloroethylene (TCE) - ug/L	5.0	Annual – 4th Qtr.	Discrete

Tetrachloroethylene (PCE) - ug/L	5.0	Annual – 4th Qtr.	Discrete
Benzene - ug/L	5.0	Annual – 4th Qtr.	Discrete
Ethyl benzene - ug/L	100.0	Annual – 4th Qtr.	Discrete
Toluene - ug/L	100.0	Annual – 4th Qtr.	Discrete
Xylene - ug/L	200.0	Annual – 4th Qtr.	Discrete
pH – SU	6.5 – 9.0	Annual – 4th Qtr.	Discrete
Total Petroleum Hydrocarbon (TPH) (C6 – C40) mg/L[3]	1.0	Annual – 4th Qtr.	Discrete

1. Samples must be collected during the first hour of discharge. For discharges that extend beyond an hour in duration, a second sample shall be collected prior to end of discharge, or as specified by the division.
2. Test results to be submitted by **Jan 28th** of the calendar year.
3. EPA Method 8015B and EPA Method 8260B, extractable and purgeable, C6-C40. Summation must meet permit limit.

A.10.3.4 Category 4 - Subsurface water discharges: Discharge Limitations, Monitoring Requirements and Conditions

Parameters	Discharge Limit - Daily Maximum	Measurement Frequency[5]	Sample Type
Flow – gallons per minute (gpm)	250	Continuous	Continuous
Total Residual Chlorine[1] - mg/L	0.10	Two/Discharge	Discrete
Total Dissolved Solids (TDS) - mg/L	Monitor & Report	Annual – 4th Qtr.	Discrete
Total Suspended Solids (TSS) - mg/L	Monitor & Report	Annual – 4th Qtr.	Discrete
Methyl tert-Butyl Ether (MTBE) - µg/L	20.0	Annual – 4th Qtr.	Discrete
Total Nitrogen as N - mg/L	10.0	Annual – 4th Qtr.	Discrete
Total Phosphorus as P	Monitor & Report	Annual – 4th Qtr.	Discrete
Trichloroethylene (TCE) - ug/L	5.0	Annual – 4th Qtr.	Discrete
Tetrachloroethylene (PCE) - ug/L	5.0	Annual – 4th Qtr.	Discrete
Benzene - ug/L	5.0	Annual – 4th Qtr.	Discrete
Ethyl benzene - ug/L	100.0	Annual – 4th Qtr.	Discrete
Toluene - ug/L	100.0	Annual – 4th Qtr.	Discrete
Xylene - ug/L	200.0	Annual – 4th Qtr.	Discrete
pH – SU	6.5 – 9.0	Annual – 4th Qtr.	Discrete
Total Petroleum Hydrocarbon (TPH) (C6 – C40) mg/L[6]	1.0	Annual – 4th Qtr.	Discrete
Barium – mg/L	2.0	Annual – 4th Qtr.	Discrete
Fluoride – mg/L	Monitor & Report	Annual – 4th Qtr.	Discrete
Iron – mg/L	1.0	Annual – 4th Qtr.	Discrete
Sulfate – mg/L	Monitor & Report	Annual – 4th Qtr.	Discrete
Molybdenum - mg/L	6.16	Annual – 4th Qtr.	Discrete
Turbidity – NTU[2, 3]	Monitor & Report	Annual – 4th Qtr.	Discrete
Fecal Coliform - MPN100 mL	Monitor & Report	Annual – 4th Qtr.	Discrete
E Coli[4] - MPN/100 mL	Monitor & Report	Annual – 4th Qtr.	Discrete
Dissolved Oxygen - mg/L	Monitor & Report	Annual – 4th Qtr.	Discrete

1. Samples must be collected during the first hour of discharge. For discharges that extend beyond an hour in duration, a second sample shall be collected prior to end of discharge, or as specified by the division.
2. BMPs shall be implemented to minimize erosion and sediment.
3. During the discharge, if a visible turbidity plume is generated, a grab sample shall be obtained. Turbidity shall be less than or equal to 10 Nephelometric Turbidity Units (NTUs) over the background value of the receiving water.
4. Single Value.
5. Test results to be submitted by **Jan 28th** of the calendar year.
6. EPA Method 8015B and EPA Method 8260B, extractable and purgeable, C6-C40. Summation must meet permit limit.

A.10.3.5 Category 5 - Utility vault water discharges: Discharge Limitations, Monitoring Requirements and Conditions

Parameters	Discharge Limit - Daily Maximum	Measurement Frequency[5]	Sample Type
Flow – gallons per minute (gpm)	250	Continuous	Continuous
Total Residual Chlorine[1] - mg/L	0.10	Two/Discharge	Discrete

1. Samples must be collected during the first hour of discharge. For discharges that extend beyond an hour in duration, a second sample shall be collected prior to end of discharge, or as specified by the division.
2. BMPs shall be implemented to minimize erosion and sediment.
3. During the discharge, if a visible turbidity plume is generated, a grab sample shall be obtained. Turbidity shall be less than or equal to 10 Nephelometric Turbidity Units (NTUs) over the background value of the receiving water.

4. Single Value.
5. Test results to be submitted by **Jan 28th** of the calendar year.
6. EPA Method 8015B and EPA Method 8260B, extractable and purgeable, C6-C40. Summation must meet permit limit.

A.11 MONITORING AND REPORTING:

A.11.1 Monitoring:

A.11.1.1 Representative Samples:

A.11.1.1.1 Samples and measurements taken as required herein shall be representative of the nature and volume of the monitored discharge. Analysis shall be performed by a State of Nevada certified laboratory. Results from this laboratory must accompany the Discharge Monitoring Report (DMR) Form; monitoring results shall be submitted to the address listed in I.D.9 within 30 days of the discharge, or as required.

A.11.1.1.2 Copies of sample and measurement results shall be maintained on site.

A.11.1.2 Recording the Results:

A.11.1.2.1 For each measurement or sample taken pursuant to the requirements of this General Uncontaminated Water Discharge Permit, the Permittee shall record the following information:

A.11.1.2.2 The exact place, date, and time of sampling;

A.11.1.2.3 The dates the analyses were performed;

A.11.1.2.4 The person(s) who performed the analyses;

A.11.1.2.5 The analytical techniques or methods used (list field testing equipment);

A.11.1.2.6 The results of all required analyses, including reporting limits.

A.11.1.3 Additional Monitoring by Permittee:

A.11.1.3.1 If the Permittee monitors any constituent at the location(s) designated herein more frequently than required by this general discharge permit, using approved analytical methods and laboratories as specified above, the results of that monitoring shall be included in the next annual or monitoring report submitted to the Division on the DMR form. Such increased frequency shall also be indicated on the DMR.

A.11.1.4 Annual Sampling:

A.11.1.4.1 Required sampling protocol is defined in Section C of the permit;

A.11.1.4.2 Discharge monitoring reports are due on January 28th (4th Quarter) of the calendar year as defined in Section A of the permit;

A.11.1.4.3 Additionally, the Permittee shall document and report inspection findings, update spill and unauthorized discharge information including clean up and preventive actions taken and report any modifications to the BMPs. The reports shall include all monitoring data collected, including data collected in accordance with Section C of this permit and a summary/ interpretation of that data;

A.11.1.4.4 The discharge shall not cause the following in the receiving water:

A.11.1.4.4.1 Concentrations of dissolved oxygen (DO) in the receiving water to fall below 7.0 mg/L. During any period when the receiving water DO concentration is already below 7.0 mg/L, the discharge shall not further diminish the DO content;

A.11.1.4.4.2 Alteration to the color, taste or odor beyond present natural ambient levels;

A.11.1.4.4.3 Turbidity in amounts which adversely affect beneficial uses in the receiving waters. Turbidity shall not increase more than 20 percent over background levels;

A.11.1.4.4.4 Significant erosion, sedimentation or alteration of the watercourse;

A.11.1.4.4.5 Biostimulatory substances to be present in concentrations that promote aquatic growths to the extent that such growths cause nuisance or adversely affect beneficial uses;

A.11.1.4.4.6 The normal ambient receiving water to be altered more than 5° F (Fahrenheit), if a temperature standard is present;

A.11.1.4.4.7 Further degradation of any 303d listed receiving water for an established parameter.

A.11.2 Reporting:

A.11.2.1 Annual Reports:

A.11.2.1.1 Annual reports are required for NDEP approved discharge operations as defined in Section C of the permit.

A.11.2.1.2 Annual monitoring results obtained pursuant to Section A of the permit are due each January 28th (4th Quarter) of the current calendar year. Reports shall be summarized and reported on a Discharge Monitoring Report (DMR) form. The Permittee shall also submit the data in an electronic format provided by the Division addressed in Section C below.

A.11.2.1.3 Summaries of laboratory results for analyses conducted by outside laboratories must accompany the DMR, and the full data package provided by the laboratory must be provided if requested in writing by the Division. If at any time the Permittee concludes that submitted data were incorrect, the Permittee shall notify the Division in writing, identify the incorrect data, and replace the incorrect data with corrected data, which shall thereafter be used for determining compliance with this permit

A.11.2.2 Compliance Report:

A.11.2.2.1 Reports of compliance or noncompliance with, or any progress reports on, interim and final requirements contained in any compliance schedule of this permit shall be submitted no later than 14 days following each schedule date.

A.11.3 Other information:

A.11.3.1 Where the Permittee becomes aware that it failed to submit any relevant facts in a permit application, or submitted incorrect information in a permit application or in any report to the Administrator, it shall promptly submit such facts or information.

A.12 ANNUAL FEE:

A.12.1 The Permittee shall remit an annual review and services fee in accordance with NAC 445A.268 on or before July 1st of every year that the Permittee is authorized to discharge under this General Permit.

SECTION B:

B.1 GENERAL PERMIT COVERAGE FOR ONGOING PROJECTS:

B.1.1 Current permits are valid until expiration date. To be covered by this permit, holders of an expired permit must submit a new NOI with the proper filing fee.

B.2 NARRATIVE STANDARDS:

B.2.1 Discharges shall not cause the following standards to be violated in any surface waters of the state. Waters must be free from:

B.2.1.1 Substances that will settle to form sludge or bottom deposits in amounts sufficient to be unsightly, putrescent or odorous;

B.2.1.2 Floating debris, oil, grease, scum, and other floating materials in amounts sufficient to be unsightly;

B.2.1.3 Materials in amounts sufficient to produce taste or odor in the water or detectable off-flavor in the flesh of fish or in amounts sufficient to change the existing color, turbidity or other conditions in the receiving stream to such a degree as to create a public nuisance;

B.2.1.4 High temperature, biocides, organisms pathogenic to human beings, toxic, corrosive or other deleterious substances at levels or combinations sufficient to be toxic to human, animal, plant or aquatic life;

B.2.1.5 Radioactive materials must not result in accumulations of radioactivity in plants or animals that result in a hazard to humans or harm to aquatic life;

B.2.1.6 Untreated or uncontrolled wastes or effluents that are reasonably amenable to treatment or control; and

B.2.1.7 Substances or conditions, which interfere with the beneficial use of the receiving waters.

B.2.2 The narrative standards are not considered violated when the natural conditions of the receiving water are outside the established limits, including periods of high or low flow. Where effluents are discharged to such waters, the discharges are not considered a contributor to substandard conditions provided maximum treatment in compliance with permit requirements is maintained.

B.2.3 There shall be no objectionable odors from the collection system, treatment facility or disposal area, or biosolids treatment, use, storage or disposal area that the Permittee owns or operates.

B.2.4 There shall be no discharge of substances that would cause a violation of water quality standards of the State of Nevada as defined by the permit.

B.2.5 The permit may be reopened, and additional limits imposed, if it is determined that the discharge is causing a violation of ambient water quality standards of the State of Nevada.

B.2.6 There shall be no discharge from the collection, treatment and disposal facilities except as authorized by this permit or in accordance with the Division's Spill Reporting Policy.

B.2.7 The treatment and disposal facility shall be fenced and posted.

B.2.8 There shall be no discharge of floating solids or visible foam in other than trace amounts.

B.3 BEST MANAGEMENT PRACTICES (BMP):

B.3.1 BMP's shall be implement and maintained to the Maximum Extent Practicable

B.3.2 Permittees shall implement BMPs prior to commencement of discharge.

B.3.3 A Permittee shall implement the BMP requirements to ensure compliance with the terms and conditions of this general permit.

B.3.4 The Permittee shall make all BMP records and plans available to the Division upon request.

B.3.5 All sediment control measures and other protective measures must be maintained in effective operating condition.

B.3.6 If existing BMPs need to be modified or additional BMPs are necessary, implementation must be completed as soon as possible.

B.3.7 All erosion and sediment control measures and other protective measures must be maintained in effective operating condition. If site inspections identify BMPs that are not operating effectively or if the capacity has been reduced by 50%, maintenance

shall be performed.

B.3.8 NDEP may require modifications to the site BMP's.

B.4 24 HOUR REPORTING:

B.4.1 The Permittee shall orally report any noncompliance or discharge which may seriously endanger human health or the environment as soon as possible, but no later than 24 hours from the time the Permittee becomes aware of the circumstances. The report shall be made to the Division at (888) 331-6337 during normal business hours. A written report shall also be submitted to the Division within ten days of the time the Permittee becomes aware of the circumstances. The written submission shall contain a description of the event, and its cause; the period of time over which it occurred, including exact dates and times, and if the situation has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence.

B.5 PHOTOGRAPHIC DOCUMENTATION:

B.5.1 Discharges conducted under the terms and conditions of this General Permit shall also be monitored by means of photographic documentation to verify performance of the water management BMPs and the discharge point BMPs. The photographs shall be submitted with a brief summary narrative report quarterly if conditions have changed. Photographs shall be taken from established photograph points, and shall depict representative views of the discharge activities on site, as well as the scope of operations with project sites, monitoring location(s), discharge point(s), and any relevant activity related to the discharge.

C SECTION C:

C.1 DEFINITIONS AND GENERAL REQUIREMENTS:

C.1.1 **Municipal Separate Storm Sewer Systems (MS4),** as defined in 40 CFR 122.26 (b) (8) http://edocket.access.gpo.gov/cfr_2002/julqtr/40cfr122.26.htm, is a conveyance or system of conveyances that is: Owned by a state, city, town, village, or other public entity that discharges to waters of the U.S.; Designed or used to collect or convey stormwater (including storm drains, pipes, ditches, etc.); Not a combined sewer; and Not part of a Publicly Owned Treatment Works (sewage treatment plant).

C.1.2 **Best Management Practices (BMPs**) means schedules of activities, prohibitions of practices, maintenance procedures and other management practices to prevent or reduce the pollution of Waters of the U.S. BMPs also include treatment requirements, operating procedures and practices to control site runoff, spillage, leaks, or other sources of pollution.

C.1.3 **DeMinimis discharge** means a discharge that is relatively pollutant free water which when discharged, in conjunction with appropriate BMPs that are used to reduce any and all pollutants to below the applicable limits set by this permit, has minimal or no

adverse impact to the environment or public health.

C.1.4 **Utility** means a system to provide for the distribution of water, natural gas, electricity, communications (including telephone, cellular telephone towers, and fiber optics), cable television and other such systems.

C.1.5 **Waters of the U. S**. is defined at 40 CFR §122.2, and includes but is not limited to lakes, reservoirs, ponds, rivers, streams (including intermittent and ephemeral streams), creeks, washes, draws, sloughs, playas and wetlands.

C.1.6 **303 (d) List - Nevada:** Criteria – Please see the following link: http://ndep.nv.gov/bwqp/file/303d_list09.pdf

C.1.7 **303 (d) List - Nevada:** Nevada's 303(d) List of Impaired Waters – Please see the following link: http://ndep.nv.gov/bwqp/file/303d_list09-att1.pdf

C.2 TEST PROCEDURES:

C.2.1 Test procedures for the analysis of pollutants shall conform to regulations (40 CFR, Part 136) published pursuant to Section 304(h) of the Act, under which such procedures may be required unless the Division approves other procedures. For the purpose of this permit, the Permittee may use alternate field test kits and instrumentation for field screening. Field testing is permitted, using suitable methods for flow, pH, total chlorine residual and temperature.

C.3 PLANNED CHANGES:

C.3.1 The Permittee shall give notice to the Administrator as soon as possible of any planned physical alterations or additions to the permitted facility.

C.3.2 Notice is required only when the alteration or addition to a permitted facility, may meet one of the criteria for determining whether a facility is a new source (40 CFR 122.29(b)), or could significantly change the nature or increase the quantity of pollutants discharged.

C.4 ANTICIPATED NON-COMPLIANCE:

C.4.1 The Permittee shall give advance notice to the Administrator of any planned changes in the permitted facility or activity, which may result in noncompliance with permit requirements.

C.4.2 Reports shall include a certification that the Permittee is in compliance with the permit, and identify any incidents of non-compliances; a narrative explanation must be attached to every non-compliance incident.

C.5 ADDRESS FOR SUBMITTAL:

C.5.1 All monitoring results and annual reports shall be submitted to the Division; an original signed copy of all reports required herein, shall be submitted to the Division at the following address:

Division of Environmental Protection
Bureau of Water Pollution Control
901 South Stewart Street, Suite 4001
Carson City, Nevada 89701
ATTN: Compliance Coordinator

C.6 CHANGE IN DISCHARGE:

C.6.1 All discharges authorized herein shall be consistent with the terms and conditions of this general permit. Any anticipated new discharges at the site related to the discharges as described in Section A which will result in new, different, or increased discharges of pollutants must be reported to the Division. Pursuant to NAC 445A.263, the General Permit may be modified to specify and limit any pollutants not previously limited.

C.7 OPERATION:

C.7.1 The Permittee shall at all times maintain in good working order and operate as efficiently as possible all equipment and ancillary BMPs used by the Permittee to achieve compliance with the terms and conditions of this general discharge permit.

C.8 ADVERSE IMPACT:

C.8.1 The Permittee shall take all reasonable steps to minimize any adverse impact to receiving waters resulting from noncompliance with this General Permit, including such accelerated or additional monitoring as necessary to determine the nature and impact of the noncomplying discharge. The Permittee shall carry out such measures, as reasonable, to prevent significant adverse impacts on human health or the environment.

C.9 REMOVED SUBSTANCES:

C.9.1 Solids removed during the control of discharged water shall be disposed of in a manner to prevent pollution from such materials from entering any surface or ground water.

C.10 MODIFICATION OF MONITORING FREQUENCY AND SAMPLE TYPE:

C.10.1 After considering monitoring data, discharge flow and receiving water conditions, the Division, may, for just cause, modify the monitoring frequency and/or sample type by issuing an order to the Permittee.

C.11 RECORDS RETENTION:

C.11.1 All records and information resulting from the monitoring activities required by this General Permit, including all records of analyses performed and calibration and maintenance of instrumentation and recordings from continuous monitoring instrumentation, shall be retained for a minimum of three (3) years after approval to discharge under this permit, or longer if required by the Administrator.

C.12 DETECTION LIMITS:

C.12.1 All laboratory analysis conducted in accordance with this discharge permit must meet the following criteria:

C.12.1.1 All methods used must be specified or approved in either 40 CFR 136, SW-846 or otherwise approved by the Division. All analytical results must be generated by analytical laboratories certified by the Nevada State laboratory certification program; and

C.12.1.2 Each parameter shall have detection at or below the permit limits or the Reported Detection Level as defined in the analytical method, whichever is lower.

C.13 RIGHT OF ENTRY:

C.13.1 The Permittee shall allow the Administrator and/or his authorized representatives, upon the presentation of credentials;

C.13.2 To enter upon the Permittee's premises (and other property) where a discharge occurs and/or in which any records are required to be kept under the terms and conditions of this General Permit;

C.13.3 At reasonable times, to have access to and copy any records required to be kept under the terms and conditions of this General Permit;

C.13.4 Inspect any monitoring equipment or monitoring method required in this General Permit; or,

C.13.5 Perform any necessary inspection and/or sampling to determine compliance with this General Dewatering Permit or to sample any discharge.

C.14 TRANSFER OF OWNERSHIP OR CONTROL:

C.14.1 In the event of any change in control or ownership from which the authorized discharge emanates, the Permittee shall notify the succeeding owner or controller of the existence of this General Permit, by letter, a copy of which shall be forwarded to the Administrator. The Division must approve ALL transfers of the permit.

C.15 AVAILABILITY OF REPORTS:

C.15.1 Except for data determined to be confidential under NRS 445A.665, all reports prepared in accordance with the terms of this General Permit shall be available for public inspection at the office of the Division. As required by the Clean Water Act and NRS, discharge data shall not be considered confidential. Knowingly making any false statement on any such report may result in the imposition of criminal penalties as provided for in NRS 445A.710.

C.16 FURNISHING FALSE INFORMATION AND TAMPERING WITH MONITORING DEVICES:

C.16.1 Any person who knowingly makes any false statement, representation, or certification in any application, record, report, plan or other document filed or required to be maintained by the provisions of NRS 445A.300 to 445A.730, inclusive, or by any General Permit, rule, regulation or order issued pursuant thereto, or who falsifies, tampers with or knowingly renders inaccurate any monitoring device or method required to be maintained under the provisions of NRS 445A.300 to 445A.730, inclusive, or by any General Permit, rule, regulation or order issued pursuant thereto, is guilty of a gross misdemeanor and shall be punished by a fine of not more than $10,000 or by imprisonment. This penalty is in addition to any other penalties, civil or criminal, provided pursuant to NRS 445A.300 to 445A.730 inclusive.

C.17 PENALTY FOR VIOLATION OF PERMIT CONDITIONS:

C.17.1 NRS 445A.675 provides that any person who violates a General Permit condition is subject to administrative and judicial sanctions as outlined in NRS 445A.690 through 445A.705.

C.18 PERMIT MODIFICATION, SUSPENSION OR REVOCATION:

C.18.1 After notice and opportunity for a hearing, this permit may be modified, suspended, or revoked in whole or in part during its term for cause including, but not limited to, the following:

C.18.1.1 Violation of any terms or conditions of this permit;

C.18.1.2 Obtaining this permit by misrepresentation or failure to disclose fully all relevant facts;

C.18.1.3 A change in any condition that requires either a temporary or permanent reduction or elimination of the authorized discharge;

C.18.1.4 A determination that the permitted activity endangers human health or the environment and can only be regulated to acceptable levels by permit modification or termination;

C.18.1.5 There are material and substantial alterations or additions to the permitted facility or activity;

C.18.1.6 The Administrator has received new information;

C.18.1.7 The standards or regulations have changed; or

C.18.1.8 The Administrator has received notification that the permit will be transferred.

C.19 LIABILITY:

C.19.1 Nothing in this General Permit shall be construed to preclude the institution of any legal action or relieve the Permittee from any responsibilities, liabilities, or penalties established pursuant to any applicable Federal, State or local laws, regulations, or ordinances.

C.20 PROPERTY RIGHTS:

C.20.1 The issuance of this General Permit does not convey any property rights, in either real or personal property, or any exclusive privileges, nor does it authorize any injury to private property or any invasion of personal rights, nor any infringement of Federal, State or local laws, regulations or ordinances.

C.21 SEVERABILITY:

C.21.1 The provisions of this General Permit are severable, and if any provision of this Permit, or the application of any provisions of this Permit to any circumstance, is held invalid, the application of such provision to other circumstances, and the remainder of this Permit, shall not be affected thereby.

C.22 SIGNATURES, CERTIFICATION REQUIRED ON APPLICATION AND REPORTING FORMS:

C.22.1 All applications, reports, or information submitted to the Administrator shall be signed and certified by making the following certification.

"I hereby certify that I am familiar with the information contained in the application and that to the best of my knowledge and ability such information is true, complete, and accurate."

C.22.2 All applications, reports or other information submitted to the Administrator shall be signed by one of the following:

C.22.2.1 A principal executive officer of the corporation (of at least the level of vice president) or his authorized representative who is responsible for the overall operation of the facility from which the discharge described in the application or reporting form originates;

C.22.2.2 A general partner of the partnership;

C.22.2.3 The proprietor of the sole proprietorship; or

C.22.2.4 A principal executive officer, ranking elected official or other authorized employee of the municipal, state or other public facility.

C.23 CHANGES TO AUTHORIZATION:

C.23.1 If an authorization under Section C (Signatures, Certification Required on Application and Reporting Forms) is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new authorization satisfying the requirements of Section C (Signatures, Certification Required on Application and Reporting Forms) must be submitted to the Administrator prior to or together with any reports, information, or applications to be signed by an authorized representative.

C.24 REAPPLICATION:

C.24.1 If the Permittee desires to continue to discharge, he shall reapply not later than 180 days before this permit expires on the application forms then in use. The renewal application shall be accompanied by the fee required by NAC 445A.268.

C.25 DUTY TO PROVIDE INFORMATION:

C.25.1 The Permittee shall furnish to the Administrator, within a reasonable time, any relevant information which the Administrator may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this permit, or to determine compliance with this permit. The Permittee shall also furnish to the Administrator, upon request, copies of records required to be kept by this permit.

1 INTRODUCTION

The Maryland Square Tetrachloroethene (PCE) Site is east of downtown Las Vegas, Nevada. Shallow groundwater at the Site contains a PCE plume that extends from the location of the former Al Phillips the Cleaners (APTC), in the former Maryland Square Shopping Center (Figure 1), to approximately 6,000 feet east (downgradient), just east of Eastern Avenue (Figure 2). This plume of PCE-contaminated groundwater extends beneath the Paradise Palms residential neighborhood, more than 1,000 feet downgradient from the source area (Figure 2).

Investigation and remediation of the contamination have been undertaken by The Herman Kishner Trust (the "Trust") for itself, for the former owner (Maryland Square Shopping Center [MSSC], LLC), and for the present owner (Maryland Square, LLC). The present owner, Maryland Square, LLC has no relationship to the Trust or MSSC, LLC. After the bankruptcy of the former tenant, APTC, the Trust stepped in to conduct the remedial cleanup of the property. The Trust is currently working with the Nevada Division of Environmental Protection (NDEP), which is providing regulatory oversight for remediation of PCE contamination in soil and groundwater associated with the property.

PCE is a commercially available solvent/degreaser commonly used by dry cleaners to clean clothes. It is a colorless, nonflammable liquid that does not occur naturally. Historical discharge of PCE at the former dry cleaners was discovered during a due diligence environmental site assessment that was part of a real estate transaction, and was reported on November 29, 2000, via the NDEP spill reporting hotline (NDEP 2012). The date(s) of release of PCE at the former dry cleaners is unknown; release could have occurred anytime during operation of the dry cleaners. The APTC dry-cleaning business operated from 1969 to 2000.

A series of environmental investigations occurred at the property and off site in downgradient areas from 2000 to 2008. On-site investigations of soil and groundwater beneath the property delineated the extent of PCE-contaminated soil and established the boundary of the contaminated groundwater on and immediately adjacent to the property. Soil gas and groundwater investigations also occurred off the property to delineate the approximate extent of PCE contamination in the shallow groundwater.

In July 2005, the PCE plume was reported to extend into the residential neighborhood east of the Boulevard Mall. Additional wells installed in 2006 confirmed presence of PCE at concentrations as high as 2,500 micrograms per liter (µg/L) in portions of the plume underlying the neighborhood. In 2007, NDEP conducted vapor intrusion modeling using U.S. Environmental Protection Agency's (EPA) version of the Johnson-Ettinger model (EPA 2004) and the groundwater data. This modeling indicated potential for intrusion of PCE vapors into overlying houses at concentrations posing greater than a 1 in 1,000 risk level.

Based on results of the vapor intrusion modeling using groundwater data, NDEP directed the responsible party to conduct soil gas sampling to evaluate presence and distribution of PCE vapors in soils overlying the contaminated groundwater plume. Soil gas investigations focused on the known extent of the PCE plume on the east side of the Boulevard Mall and in the

neighborhood east of the mall. Data from this soil gas study were used as input for EPA's version of the Johnson-Ettinger model for vapor intrusion (EPA 2004). Results of the modeling indicated potential for unacceptable levels of vapor intrusion into houses overlying the PCE plume. In late August, 2007, NDEP mailed informational packages to more than 140 houses within the residential neighborhood east of the Boulevard Mall. These packages included an offer to sample indoor air within each house in the neighborhood. Most homeowners accepted the offer, and NDEP eventually sampled 97 houses and two schools between fall 2007 and winter 2007-2008.

Indoor air in 15 of the 97 houses sampled in 2007-2008 had PCE concentrations greater than the NDEP interim-action level of 32 micrograms per cubic meter ($\mu g/m^3$) (Broadbent 2010). NDEP offered to install sub-slab depressurization (SSD) systems in all 15 houses; however, one of the homeowners declined the offer. Therefore, in 2008, SSD systems were installed at 14 houses. After SSD system installation, indoor air in the houses was retested to ensure that the PCE concentrations in indoor air were less than the NDEP's interim-action level. If PCE concentrations in indoor air remained above the interim-action level, performance testing was conducted and the SSD system was modified. Subsequent sampling confirmed that all houses with SSD systems exhibited PCE concentrations less than 32 $\mu g/m^3$ in indoor air (Broadbent 2010).

In 2009, NDEP entered into negotiations with the responsible parties, and on May 4, 2009, NDEP filed a lawsuit with the U.S. District Court, District of Nevada. In the meantime, investigations and quarterly groundwater monitoring at the Site continued. During July and August, 2010, NDEP and the Attorney General worked on drafting an injunction that would satisfy the U.S. District Court.

On December 27, 2010, the U.S. District Court, District of Nevada, issued a Permanent Injunction requiring, among other matters, that annual indoor air sampling be offered to homeowners with property overlying groundwater containing PCE at concentrations of 100 µg/L or greater (U.S. District Court 2010). Houses that are found to have PCE in indoor at concentrations exceeding the NDEP interim-action level of 32 $\mu g/m^3$ are offered mitigation systems to decrease PCE concentrations in indoor air below the interim-action level.

In compliance with the Permanent Injunction, the Trust contracted with Tetra Tech EM, Inc. (Tetra Tech) to conduct the indoor air sampling. Tetra Tech prepared the *Work Plan for Mitigation of Indoor Air and Well Water* (Tetra Tech 2011a) and the *Addendum to the Work Plan for Mitigation of Indoor Air and Well Water* (Tetra Tech 2011b), which were approved by NDEP on August 23, 2011. Indoor air sampling was conducted in February and April 2012 (Tetra Tech 2012). This report documents provides the screening level human health risk assessment (SLHHRA) based on the data for samples of indoor air that were collected from residences in 2007-2008 and 2012.

2 SCREENING LEVEL HUMAN HEALTH RISK ASSESSMENT

The primary objective of the SLHHRA is to determine whether site contaminants pose a current or potential risk to human health in the absence of remediation. The SLHHRA helps to evaluate whether further remediation is necessary at the site.

Tetra Tech conducted the SLHHRA for the Maryland Square PCE Site consistent with EPA and state guidance. The primary guidance documents used in preparing the SLHHRA are listed below. This list is not comprehensive, as other EPA and state guidance documents, as well as documents prepared by other organizations, were used as appropriate.

1. *Risk Assessment Guidance for Superfund* (RAGS), *Volume 1: Human Health Evaluation Manual (Part A)* (EPA 1989).
2. RAGS, *Volume I: Human Health Evaluation Manual, Supplemental Guidance: Standard Default Exposure Factors* (EPA 1991a).
3. *Draft Guidance for Evaluating the Vapor Intrusion to Indoor Air Pathway from Groundwater and Soils (Subsurface Vapor Intrusion Guidance)* (EPA 2002).
4. *Human Health Toxicity Values in Superfund Risk Assessments* (EPA 2003).
5. RAGS, *Volume 1: Human Health Evaluation Manual (Part F, Supplemental Guidance for Inhalation Risk Assessment)* (EPA 2009).

As described in RAGS, the risk assessment proceeded in four basic steps: (1) data evaluation and identification of contaminants of potential concern (COPC), (2) exposure assessment, (3) toxicity assessment, and (4) risk and hazard characterization. In addition, the SLHHRA included a discussion and evaluation of significant sources of uncertainties in the risk assessment process as applied at the Maryland Square PCE Site.

2.1 DATA EVALUATION AND IDENTIFICATION OF COPCs

The SLHHRA is based on the data from indoor air samples collected at houses within the Paradise Palms neighborhood. All chemicals detected in the samples were selected as COPCs.

2.1.1 Data from Samples of Indoor Air

Data from samples of indoor air were available from two separate sampling and analysis efforts at the site:

- 2007-2008 Sampling by Broadbent (Broadbent 2010) on behalf of NDEP
- 2012 Sampling by Tetra Tech (Tetra Tech 2012) on behalf of the Trust.

Results from the indoor air sampling are listed in Table 1.

2007-2008 Indoor Air Sampling

In 2007, NDEP offered indoor air sampling to more than 140 homeowners within the Paradise Palms neighborhood. Most homeowners accepted the offer, and NDEP eventually sampled 97 houses and two schools between fall 2007 and winter 2007-2008.

Of the 97 houses sampled, PCE was:

- Not detected in 55 houses or at either school
- Detected at concentrations below the interim-action level in samples from 27 of the houses
- Detected at concentrations above the interim action level in 15 houses.

NDEP offered to install SSD systems in all 15 houses with PCE concentrations exceeding the interim-action level of 32 µg/m^3. One of the owners declined the offer, and SSD systems were installed at 14 of the 15 houses.

2012 Indoor Air Sampling

Houses were selected for indoor air sampling during February and April 2012 by overlaying the January 2012 groundwater contour map on the Clark County Assessor's Parcel Number maps for the Paradise Palms neighborhood, and identifying parcels that lay within (or partially within) the 100 µg/L contour of the groundwater plume (vapor intrusion [VI] area of concern). Figure 3 shows the 100 µg/L groundwater PCE contour on a map with the parcels. Indoor air sampling was offered to any homeowner whose property lay partially or wholly within the 100 µg/L contour.

Of the 103 homeowners sent a notification package, 41 homeowners responded and 32 houses were sampled. Tetra Tech conducted the indoor air sampling in accordance with the *Work Plan for Mitigation of Indoor Air and Well Water* (Tetra Tech 2011a) and the Addendum to the Work Plan for Mitigation of Indoor Air and Well Water (Tetra Tech 2011b). NDEP oversaw the in-home surveys and indoor air sampling. Results of the indoor air sampling are presented in the Indoor Air Sampling Report (Tetra Tech 2012).

Indoor air sampling began with an in-home survey followed by indoor sampling within 1 week. The in-home surveys involved completing a questionnaire with the occupant and conducting a walkthrough of the house prior to sampling to assess any potential sources of volatile organic compounds (VOC). If a potential source was identified, the occupant was asked to remove it from the house 24 hours prior to sampling. If no potential sources of chlorinated solvents were observed during the in-home surveys, Tetra Tech collected a time-integrated sample of indoor air over a 24-hour sampling period. In addition, during each 24-hour sampling period, an outdoor background sample was collected to monitor for any possible VOCs present in the atmosphere. The samples were analyzed for PCE, trichloroethene (TCE), *cis*-1,2-dichloroethene (DCE), *trans*-1,2-DCE, and vinyl chloride. For quality control purposes, duplicate samples were

collected at a rate over 10 percent. The higher of the two duplicate sample results for properties with duplicate samples was used in the SLHHRA.

Of the 32 houses sampled in 2012, PCE was:

- Not detected in one house
- Detected at concentrations below the interim-action level in samples from 28 of the houses (1 of which has an SSD system)
- Detected at concentrations above the interim action level in three houses. (All three owners have agreed to SSD system installation, completion of which is anticipated in mid-2013.)

Trace concentrations of TCE were detected in two houses, and a trace concentration of vinyl chloride was detected in one house. *Cis*-1,2-DCE and *trans*-1,2-DCE were not detected in any of the indoor air samples. A summary of the sample results is in Table 1.

All properties were evaluated and sorted into one of eight different groups depending on property location, availability of indoor air sample data, and resulting analytical data (see Table 2).

- Group 1 – Seventeen properties have had or will have SSD systems installed. These properties were not evaluated further in the SLHHRA because vapor intrusion to indoor air has been mitigated for these houses. Monitoring of indoor air concentrations will continue in these houses to ensure the mitigation remains successful.
- Group 2 – Thirty-two properties outside the defined 100 µg/L contour for PCE in groundwater were sampled in 2007-2008. PCE was not detected in the property-specific indoor air samples in these 32 houses. These properties–all outside the VI area of concern–were not considered further in the SLHHRA.
- Group 3 – Eleven properties inside the defined 100 µg/L contour for PCE sampled in 2007-2008 had no PCE detected in the property-specific indoor air samples. These properties were eligible for sampling during 2012, but samples were not collected because the homeowners chose not to participate (indoor air sampling was voluntary). These properties were not evaluated further in the SLHHRA because all samples associated with these properties do not have detected concentrations of PCE or other VOCs. These houses are eligible for future sampling. If future sampling occurs, the results will be evaluated and included in future risk assessments.
- Group 4 – Three properties outside the defined 100 µg/L contour for PCE sampled in 2007-2008 had PCE detections in the property-specific indoor air samples. These properties were not sampled during 2012. These properties were evaluated quantitatively in the SLHHRA using the results from the 2007-2008 sampling.
- Group 5 – Twenty properties inside the defined 100 µg/L contour for PCE were sampled during 2007-2008 and 2012. These properties were evaluated quantitatively in the SLHHRA. The higher of the detected concentrations was used to estimate potential risks from indoor air at the site.
- Group 6 – Fourteen properties inside the defined 100 µg/L contour for PCE sampled during 2007-2008 had detectable concentrations of PCE in the property-specific indoor

air samples. These properties were not sampled during 2012. These properties were evaluated quantitatively in the SLHHRA using the data from the samples collected in 2007-2008.

- Groups 7 – Eight properties inside the defined 100 µg/L contour for PCE were only sampled in 2012. Detectable concentrations of PCE were found in the property-specific indoor air samples. These properties were evaluated quantitatively in the SLHHRA using the 2012 sampling results.
- Group 8 – Thirty-three properties inside the defined 100 µg/L contour for PCE had no indoor air sampling results because the homeowners chose not to participate (indoor air sampling is voluntary). Potential risks from inhalation of indoor air at these properties were evaluated qualitatively. These houses are eligible for future sampling. If future sampling occurs, the results will be evaluated and included in future risk assessments.

2.1.2 Identification of COPCs

The COPCs for the Maryland Square PCE Site are all chemicals detected in indoor air samples from the houses. Thus, the COPCs evaluated in this SLHHRA are PCE, TCE, and vinyl chloride.

PCE has been used commercially in the United States since the mid-1930s in dry cleaning, textile processing, and metal-cleaning operations. Of these industries, dry cleaners are the single largest users of PCE and widely continue to use the solvent due to its low flammability hazard and ability to dissolve greases, oils, and waxes without damaging fabric quality. Unfortunately, PCE does not degrade quickly in the environment and may remain in high concentrations in the subsurface for decades following a spill. TCE is a breakdown product of PCE. Vinyl chloride is a breakdown product of PCE and TCE.

2.2 EXPOSURE ASSESSMENT

An exposure assessment evaluates the type and magnitude of exposures to a human receptor from COPCs at a site. The exposure setting consists of the physical setting (including natural and man-made features), land uses, and populations living near the site. This information forms the foundation for selecting potential receptors, exposure pathways, and exposure parameters.

An exposure assessment is a multistage process. First, the receptors or individuals at risk are identified. Then, the complete exposure pathways by which these receptors are likely to be exposed are identified. The final step is to quantify the chemical concentrations to which the receptors might be exposed and the intake of COPCs associated with each pathway of exposure.

The following sections identify the potential receptors and exposure pathways evaluated in the SLHHRA. The final step of the exposure assessment, quantification of COPC intake by exposure pathway, was not used in the SLHHRA because the SLHHRA used risk-based screening concentrations and a ratiometric approach to estimate risks (see Section 2.4).

2.2.1 Potential Receptors

The source area for the Maryland Square PCE plume is within a commercial area; however, the PCE-contaminated groundwater extends beneath both commercial and residential areas. Only the residential area overlying the plume of contaminated groundwater was evaluated in this SLHHRA. Thus, the SLHHRA evaluated risks for the residential receptor. These evaluated risks are not applicable to commercial or industrial receptors in other areas of the Site. Generally, risks to commercial or industrial workers are estimated to be lower than risks to residential populations because exposure times are less.

2.2.2 Exposure Pathway Identification

Exposure pathways considered in the SLHHRA are identified through a human health conceptual site model (CSM). The CSM links potential or actual contaminant releases to potential human exposures. Specifically, the CSM identifies (1) potential contaminant sources and mechanisms of release, (2) potential receptors and exposure pathways, and (3) exposure scenarios. Figure 4 shows the human health CSM for the Maryland Square PCE site evaluated in this SLHHRA

Consistent with RAGS (EPA 1989), the SLHHRA for the Maryland Square PCE Site considered only complete (or potentially complete) exposure pathways. As described in RAGS, an exposure pathway generally consists of four elements: (1) a source and mechanism of chemical release, (2) a retention or transport medium (or media in cases involving media transfer of chemicals), (3) a point of potential human contact with the contaminated medium, and (4) an exposure route (for example, inhalation). A well survey was completed as part of the *Underground Injection Control Permit Application – Form U210* completed as part of the groundwater remediation pilot study (NDEP 2013). The well survey did not locate any domestic water wells in the Paradise Palms neighborhood evaluated in this SLHHRA. Thus, as shown on Figure 4, the only complete exposure pathway expected at residences is inhalation of VOCs entering buildings through vapor intrusion.

In soil and groundwater, PCE (and breakdown products) can move away from contamination sources via migration through spaces between soil particles or through preferential pathways such as utility lines, and reach overlying buildings due to concentration and pressure differences. Soil vapor enters buildings through cracks in slabs or basement floors and walls, and through openings around sump pumps or where pipes and electrical wires go through the foundation. Heating, ventilation, or air-conditioning systems may create a negative pressure within the building that can draw soil vapor into the building. Upon entry of the vapor into the structure, the contaminated gas spreads out in the indoor air and results in potential human exposure to PCE throughout the structure, not just at the level or location of vapor entry. Ventilation of buildings further reduces the concentration in the air.

2.3 TOXICITY ASSESSMENT

The toxicity assessment identifies the toxicity factors used to quantify potential adverse effects including both carcinogenic and non-carcinogenic effects on human health associated with

potential exposure to site-specific COPCs. The COPC-specific toxicity factors are from EPA's Integrated Risk Information System (IRIS) (EPA 2013). The toxicity and other chemical-specific values used in this SLHHRA are listed in Table 3.

2.3.1 Carcinogenic Toxicity Factors

EPA has labeled PCE as "likely to be carcinogenic in humans by all routes of exposure" (EPA 2013). Carcinogenic toxicity factors known as inhalation unit risk factors (IUR) are used to assess inhalation cancer risk. An IUR is the upper-bound excess lifetime cancer risk estimated to result from continuous exposure to a chemical at a concentration of 1 µg/m^3 in air. Long-term inhalation of PCE poses an increased lifetime risk of developing certain cancers. Cancers associated with exposures include cancers of the esophagus, bladder, and non-Hodgkin's lymphoma. Cancers less clearly associated with exposures include cancers of the cervix, tongue, and lung (EPA 2013).

Following EPA (2005) *Guidelines for Carcinogen Risk Assessment*, TCE is characterized as "carcinogenic to humans" by all routes of exposure. This conclusion is based on convincing evidence of a causal association between TCE exposure in humans and kidney cancer. The human evidence of carcinogenicity from studies of TCE exposure is also strong for non-Hodgkin's lymphoma, as well as liver and biliary tract cancer. The available studies also provide more limited evidence of an association between TCE exposure and other types of cancer, including bladder, esophageal, prostate, cervical, breast, and childhood leukemia.

Carcinogenicity of vinyl chloride in humans has been demonstrated in a number of studies and case reports. In addition to liver cancer, exposure to vinyl chloride also has been linked to an increased risk of lung, brain, hematopoietic, and digestive tract cancers (EPA 2013).

2.3.2 Non-carcinogenic Toxicity Factors

Chronic non-carcinogenic toxicity factors known as inhalation reference concentrations (RfC) are used to assess noncancer hazards. An RfC is an estimate (with uncertainty spanning perhaps an order of magnitude) of a continuous inhalation exposure of a chemical to the human population through inhalation (including sensitive subpopulations) likely to be without risk of deleterious noncancer effects during a lifetime.

Human health effects resulting from inhalation of PCE-contaminated air depend on the concentration of the contaminant in indoor air, and the length and frequency of exposure. Short-term (acute) inhalation exposures to very high concentrations of PCE vapors can cause dizziness, headache, noise and throat irritation, sleepiness, changes in behavior, and nausea. Concentrations of this magnitude (1,500 µg/m^3) are typically limited to occupational exposures in poorly ventilated work areas. Exposures greater than 1,500 µg/m^3 have been associated with reduced scores on color vision tests, and liver and kidney damage among workers at dry cleaners following occupational exposure. Long-term exposures (greater than 14 days) at concentrations higher than 150 µg/m^3 have been associated with reduced scores on tests for visual perception, reaction time, and attention (EPA 2013).

The main noncancer health effects of concern with TCE are effects on the liver and the central nervous system. Human and animal data indicate that exposure to TCE can also result in toxic effects on a number of other organs and systems, including the kidneys, blood, skin, immune system, reproductive system, and cardiovascular system (EPA 2013).

Vinyl chloride is a central nervous system depressant. Longer-term toxic effects observed in people exposed by inhalation to vinyl chloride include liver toxicity, nerve damage, immune reactions, and, at high levels of exposure, a vascular disorder of the extremities (ATSDR 2006).

2.4 RISK CHARACTERIZATION

Risk characterization calculates an estimate of the cancer risks and noncancer hazards. The risk characterization combines the exposure estimates calculated in the exposure assessment with the toxicity factors for each receptor, COPC, and exposure pathway. Cancer risks and noncancer hazards are calculated following methods described in RAGS (EPA 1989) and summarized below.

Screening-level cancer risks and noncancer hazards from exposure to COPCs in indoor air were estimated using risk-based concentrations (RBC) and the ratiometric (also known as "risk ratio") procedure. Maximum detected concentrations in indoor air at each house were used as exposure point concentrations (EPC), and EPA indoor air RSLs (EPA 2012) were used as RBCs. The maximum detected concentration of each COPC was used as the EPC for houses without indoor air data.

RSLs are health-based concentrations of individual chemicals that correspond to a cancer risk of 1 in 1 million (1E-06) for carcinogens or a hazard quotient (HQ) of 1 for noncarcinogens. RSLs for residential air were used to estimate health risks for exposure to groundwater contamination through VI to indoor air.

Generic RSLs are based on default exposure parameters and factors that represent Reasonable Maximum Exposure (RME) conditions for long-term/chronic exposures, and are based on the methods outlined in RAGS, Supplemental Guidance (EPA 1991a). Table 4 presents the default exposure parameters used in the RSLs.

Exposure time – The time span of building occupancy was assumed to be 24 hours per day for each house, consistent with EPA (2012) default exposure duration for residential exposure.

Exposure frequency – An exposure frequency of 350 days per year (7 days per week times 50 weeks per year) was assumed for each house, consistent with EPA (2012) default exposure duration for residential exposure.

Exposure duration – An exposure duration of 30 years was assumed consistent with EPA (2012) default exposure duration for residential exposure.

Averaging time – The averaging time for estimating cancer risk is the number of hours in a 70-year lifetime (that is, 25,500 days), as recommended by EPA (1989, 2012). The averaging

time for addressing noncancer health effects for residents is equal to the exposure duration (in years) times 365 days per year (that is, 10,950 days), as recommended by EPA (1989, 2012).

2.4.1 Cancer RSL Calculation

The RSL for inhalation cancer risk is calculated using the following equation:

$$RSL_c(inhalation) = \frac{TR \times AT_c}{EF \times ED \times ET \times IUR \times CF}$$

where:

RSL_c	=	Cancer-based RSL in µg/m^3 for indoor air
TR	=	Target Cancer Rate (unitless)
AT_c	=	Averaging Time for carcinogenic risk (days)
EF	=	Exposure Frequency (days/year)
ED	=	Exposure Duration (years)
ET	=	Exposure Time (hours/day)
IUR	=	Inhalation Unit Risk, chemical-specific (µg/m^3)$^{-1}$
CF	=	Conversion Factor (1 day/24 hours)

2.4.2 Noncancer RSL Calculation

The RSL for inhalation noncancer hazard is calculated using the following equation:

$$RSL_{nc}(inhalation) = \frac{THQ \times AT_{nc} \times CF_1}{EF \times ED \times ET \times {}^{1}\!/\!_{RfC} \times CF_2}$$

where:

RSL_{nc}	=	Noncancer-based RSL in µg/m^3 for indoor air
THQ	=	Target Hazard Quotient (unitless)
AT_{nc}	=	Averaging Time for noncarcinogenic hazard (days)
EF	=	Exposure Frequency (days/year)
ED	=	Exposure Duration (years)
ET	=	Exposure Time (hours/day)
RfC	=	Reference Concentration, chemical-specific (milligrams per cubic meter [mg/m^3])
CF_1	=	Conversion Factor (1,000 µg/mg)
CF_2	=	Conversion Factor (1 day/24 hours)

2.4.3 Ratiometric Method for Estimating Cancer Risks

The cancer risk associated with exposure to a single COPC was estimated by comparing the maximum concentration with the cancer RSL using the following equation:

$$Cancer\ Risk_n = (EPC_n/RSL_{c,n}) \times 1E\text{-}06$$

where:

Cancer risk$_n$	=	Cancer risk associated with exposure to a single chemical (unitless)
EPC	=	Exposure Point (maximum) Concentration for indoor air (µg/m^3)
RSL$_c$	=	Cancer-based RSL for air (µg/m^3)

Individuals may be exposed to more than one COPC at a given site. The total risk from exposure to multiple chemicals was calculated using the following equation:

$$Cancer\ Risk = 1E\text{-}06 \times \{EPC_1/RSL_1 + EP\ C_2/RSL_2 + \ldots EPC_n/RSL_{c,n}\}$$

where:

Cancer Risk	=	Total cancer risk from exposure to all chemicals (unitless)
EPC$_n$	=	Exposure point concentration (maximum) of chemical *n* for indoor air (µg/m^3)
RSL$_{c,n}$	=	Cancer-based RSL for air for chemical *n* (µg/m^3)

2.4.4 Ratiometric Method for Estimating Noncancer Hazards

The noncancer hazard associated with exposure to a single chemical was estimated by comparing the maximum concentration with the noncancer RSL for each COPC. When calculated for a single chemical, this comparison estimates an HQ that is expressed in the following equation:

$$HQ_n = EPC_n/RSL_{n,n}$$

where:

HQ$_n$	=	Noncancer hazard quotient associated with exposure to chemical *n* (unitless)
EPC$_n$	=	Exposure Point (maximum) Concentration of chemical *n* for indoor air (µg/m^3)
RSL$_{n,n}$	=	Noncancer RSL for air for chemical *n* (µg/m^3)

The HQs for all chemicals are summed to evaluate the potential for adverse health effects other than cancer from concurrent exposures to multiple chemicals. This summation yields a hazard index (HI) as follows:

$$HI = \Sigma\ HQ_n$$

2.4.5 Interpretation of Risk and Hazard Estimates

The estimated cumulative cancer risks are compared with a "risk management range" to aid in the interpretation of results. EPA defined general remedial action goals for sites in the National Oil and Hazardous Substances Pollution Contingency Plan (Title 40 of the *Code of Federal*

Regulations, Section 300.430). The goals include a range for residual cancer risk, which is "an excess upper-bound lifetime cancer risk to an individual of between 10^{-4} and 10^{-6}," or 1 in 10,000 (1E-04) to 1E-06.

A subsequent EPA directive provided additional guidance on the role of human health risk assessments in supporting risk management decisions and, in particular, evaluating whether a response action is necessary (EPA 1991b). That guidance states: "Where cumulative carcinogenic risk to an individual based on reasonable maximum exposure for both current and future land use is less than 10^{-4}, and the noncancer hazard quotient is less than 1, action generally is not warranted unless there are adverse environmental impacts." This SLHHRA refers to the cancer risk range between 1E-06 and 1E-04 as the "risk management range." The lower end of the range, 1E-06, is referred to as the "point of departure." Risks that do not exceed the point of departure are considered negligible and do not require action.

An HI less than 1 indicates that adverse noncancer health effects are not expected. If the total HI exceeds 1, further evaluation in the form of a segregation of the HI via a target organ analysis may be performed to assess whether the noncancer HIs are a concern (EPA 1989, 1991b).

2.5 RESULTS OF THE RISK EVALUATION

Health risks were quantitatively estimated for inhalation exposure at 45 houses. Included in the quantitative assessment were 42 houses lacking SSD systems, and situated above the defined 100 µg/L contour for PCE, and at which detectable concentrations of PCE had been found. Three houses not within the defined 100 µg/L contour for PCE, and at which detectable concentrations of PCE had been found, were also evaluated quantitatively. Sampling was offered to any homeowner whose property lay partially or wholly within the 100 µg/L contour; however, 33 houses within the VI area of concern have not undergone air sampling. These 33 properties were evaluated qualitatively.

2.5.1 Estimated Cancer Risks

None of the houses in the quantitative evaluation had an estimated potential cancer risk exceeding the 1E-04 action level. The highest estimated potential cancer risk was 5E-06. This estimated risk occurred at Broadbent identification (ID) 985. This house was not sampled by Tetra Tech in 2012 (ID 1626) because access was not granted. The measured indoor air concentration of PCE at this house was 43 µg/m^3, which exceeds the interim action level of 32 µg/m^3 established by NDEP. This house is eligible for installation of an SSD system; however, the homeowner refused the installation. Table 5 presents cancer risk estimates for the 45 houses included in the quantitative risk assessment.

At 22 houses, estimated potential cancer risk was within the risk management range (1E-06 to 1E-04) (Table 5). Of the 22 houses, nine had risks equivalent to the low end of the risk management range at 1E-06.

The houses with estimated risks within the risk management range are primarily on Seneca Lane or Maricopa Way. Two of the houses in the risk range are on Ottawa Drive, and two are

on Cherokee Lane. One of the houses is at the eastern edge of the VI area of concern on Ottawa Circle. Two of the houses outside the 100 µg/L groundwater PCE contour had estimated cancer risks within the risk management range.

Twenty-three houses included in the quantitative assessment had estimated potential cancer risks of less than 1E-06. Cancer risk from inhalation of PCE-contaminated indoor air is considered negligible at these houses.

2.5.2 Estimated Noncancer Hazards

None of the houses included in the quantitative SLHHRA had an estimated noncancer hazard (HI) exceeding the action level of 1. One house, at Broadbent ID 985, had an estimated HI equal to 1. This house had not been sampled by Tetra Tech in 2012 (ID 1626) because access was not granted. The measured indoor air concentration of PCE at this house was 43 µg/m^3, exceeding the interim action level of 32 µg/m^3 established by NDEP. This house is eligible for installation of an SSD system; however, the homeowner refused the installation. Table 5 presents noncancer hazard estimates for the 45 houses included in the quantitative risk assessment.

At all other houses included in the quantitative SLHHRA, the estimated noncancer hazard (HI) was less than 1; thus, all are below a level of concern for non-cancer inhalation hazards from vapor intrusion of PCE to indoor air.

2.5.3 Qualitative Assessment of Houses without Indoor Air Sample Results

Potential for vapor intrusion is based on many site-specific factors including underground conditions, soil properties, and building properties, as well as activities and habits of residents. In general, houses situated above higher concentrations of PCE in groundwater are more likely to be at risk from vapor intrusion. However, concentrations in indoor air within houses above the PCE plume may not correlate to concentrations in groundwater because vapor migration is not constrained by hydraulic gradients like groundwater, and subsurface conditions may allow for preferential pathways. This unpredictable behavior of contaminants at vapor intrusion sites poses challenges for assessing risk at houses without indoor air data.

At the Maryland Square PCE Site, the highest concentration of PCE in indoor air (110 µg/m^3) was found in a house half-way down Seneca Lane. This house is nearest well MW-25, where PCE concentrations in groundwater have ranged from 640 to 1,300 µg/L (averaging 780 µg/L). In comparison, two houses near well MW-18 contained PCE concentrations of non-detected, 11, 21, and 49 µg/m^3. MW-18 has yielded groundwater samples containing from 930 to 3,500 µg/L (averaging approximately 1,500 µg/L) PCE. Thus, houses overlying the highest concentrations in the groundwater plume did not exhibit the highest concentrations of PCE in indoor air.

Residents/owners of 33 parcels within the VI area of concern have been offered indoor air sampling but, to date, those houses have not undergone sampling because the owners/residents have not consented to that. Assuming the highest detected concentrations would be found in the houses not having undergone indoor air sampling, the estimated cancer

risk is 3E-05 and the estimated non-cancer hazard (HI) is 7 (Table 5). This estimated potential cancer risk is within the cancer risk range of 1E-06 to 1E-04, while the estimated non-cancer hazard exceeds the HI=1 threshold.

The uncertainty level associated with assigning indoor air concentrations found at three houses to other houses is very high. Use of these indoor air concentrations assumes subsurface and building conditions responsible for the indoor air concentrations found within the sampled houses apply to the houses not sampled. Moreover, results of sampling at other houses in the area have confirmed that the distribution of PCE concentrations in indoor air does not correlate to the distribution of PCE concentrations in groundwater. Indoor air concentrations above a level of concern are possible in any of the houses above the plume because of the possibility of preferential vapor pathways such as utility conduits, or individual building properties such poor foundation condition or ventilation properties of the house. Indoor air sampling is necessary to quantitatively assess the risk to any individual property above the plume.

3 UNCERTAINTY ASSESSMENT

The risks and hazards calculated as part of the SLHHRA for the Maryland Square PCE Site are subject to various degrees of uncertainty from a variety of sources associated with all the major phases of the human health risk assessment (HHRA) process. The uncertainty assessment identifies and discusses the nature of the uncertainty associated with the most significant sources of site-specific uncertainty.

It should be noted that human health implications related to PCE, or any other type of contaminant exposure, are not entirely based on the concentration and time period of exposure. Individual differences among the exposed population also play a role in the human health response. Individual traits including, but not limited to, differences in age, sex, diet, health status, family history of disease, and personal lifestyle choices can affect individual sensitivity to chemical exposures and the severity of response.

The objectives of the uncertainty analysis, defined by EPA (EPA 1989, 1992), are as follows:

- Provide a summary of those factors that significantly influence the risk results, evaluate their range of variability, and assess the contribution of these factors to underestimation or overestimation of risk.
- Discuss the data underlying the assumptions that most significantly influence risk, to highlight the strengths and weaknesses of the HHRA results.

Virtually every step in the HHRA process requires numerous assumptions, all of which contribute to uncertainty in the risk evaluation. In the absence of empirical or site-specific data, assumptions are developed based on best estimates of data quality, exposure parameters, and dose-response relationships.

To assist in the development of these estimates, EPA provides guidelines and standard default exposure factors to be used in HHRAs (EPA 1989, 1991a). Use of these standard factors is intended to promote consistency among risk assessments where assumptions must be made. However, their usefulness in accurately predicting risk depends on their applicability to the site-specific conditions. It is likely, therefore, that the net effect of all the assumptions yields a conservative estimate of total risk. However, the uncertainty analysis does not change the quantitative risk characterization results presented in Section 2.5.

3.1 UNCERTAINTIES RELATED TO DATA EVALUATION AND COPC SELECTION

The following are some of the uncertainties related to the data evaluation and reduction approaches (Section 2.1) used in this SLHHRA.

For the majority (24) of the houses included in the quantitative risk analysis, a single sample result was used to estimate the risk. Concentrations of chemicals in groundwater may exhibit seasonal variations, and changes in use of heating or air conditioning systems can greatly affect vapor concentration in a house. It is not known whether results from a single sample lead to overestimation or underestimation of actual concentrations in any given house.

Eleven of the houses with non-detected results from the 2007-2008 sampling had detected results when re-sampled in 2012. Two of these detected results exceeded the NDEP interim-action level of 32 µg/m^3. (One house with a detected result in 2007 had a non-detected result in 2012, even though no known mitigation had occurred at the house.) These results illustrate the potential temporal variability of PCE concentrations in a given house. It is not known whether other houses with previously non-detected results that were not re-sampled have also changed. This lack of sampling data may underestimate the risk at a given house if the conditions have changed.

For houses with duplicate or multiple sample results, the data were reduced to the higher of the reported results. This assumption is conservative.

3.2 EXPOSURE ASSESSMENT UNCERTAINTIES

This SLHHRA represents an estimated risk to an RME. RME is defined as the "maximum exposure that is reasonably expected to occur at the site" (EPA 1989). Several significant variables that determine the exposure doses for the RME are based on upper-bound (typically 90th to 95th percentile or greater) estimates. Therefore, where RME assumptions are employed, the calculated exposure dose for any given chemical that results from integration of all these variables represents an upper-bound estimate of the probable exposure dose. Use of these upper-bound exposure parameters, coupled with conservative estimates of toxicity, in turn, yield risk results that represent an upper-bound estimate of the carcinogenic risk and noncarcinogenic HI. Significant site-specific uncertainties associated with the exposure assessment include:

- Concentrations of chemicals in groundwater may exhibit seasonal variations. At this site, indoor air data are used to calculate indoor air EPCs. The actual risk for the inhalation pathway may be slightly underestimated or overestimated due to seasonal variations and ongoing degradation processes.
- For houses with two detected sample results, the higher of the detected results is used as the exposure concentration. The EPC is generally an average concentration, and thus use of the maximum concentration is protective.

3.3 TOXICITY ASSESSMENT UNCERTAINTIES

For a risk to exist there must be significant exposure to the COPCs and the COPCs must be toxic at the predicted exposure levels. Toxicological uncertainties primarily relate to the methodology by which inhalation unit risk and reference doses are developed. In general, the methodology currently used to develop slope factors and reference doses is conservative and likely results in an overestimation of human toxicity (EPA 1989).

3.3.1 Uncertainty in Cancer Toxicity Values

Although evidence suggests some carcinogens may exhibit thresholds, cancer IUR factors are developed assuming no safe level of exposure to any chemical proven or suspected to cause cancer. This approach implies that exposure to even a single molecule of a chemical may be

associated with a finite risk, however small. The assumption is that even if relatively large doses of a contaminant are required to cause cancer in toxicity studies, these exposure doses can be linearly extrapolated downward many orders of magnitude to estimate cancer slope factors for humans. A significant uncertainty regarding the carcinogens is whether the IUR factors accurately reflect the carcinogenic potency of these chemicals at low exposure concentrations. The IUR is used to estimate an upper-bound lifetime probability of an individual developing cancer as a result of exposure to a particular level of a carcinogen. Therefore, the cancer IUR factors developed by EPA are generally conservative and represent the upper-bound limit of the carcinogenic potency of each chemical. The actual risk posed by each chemical is unknown, but is likely to be lower than the calculated risk and may even be as low as zero (EPA 1989). The conclusion is that these toxicity assumptions typically result in an overestimation of carcinogenic risk.

3.3.2 Uncertainty in Noncancer Toxicity Values

In the development of inhalation RfCs, it is assumed that a threshold dose exists below which there is no potential for adverse health effects to the most sensitive individuals in the population. The RfC is typically derived by applying several uncertainty factors of 10 each to a no observed adverse effects level (NOAEL) or a lowest observed adverse effects level (LOAEL) determined from a dose-response study in animals. An additional modifying factor of up to 10, which accounts for a qualitative professional assessment of additional uncertainties in the available toxicity data, also may be applied (EPA 1989). The final degrees of extrapolation for the contaminants detected in indoor air samples ranged from 30 for vinyl chloride to 1,000 for PCE (see Table 3) and, therefore, result in probable overestimates of risk by up to the same degree. In general, the calculated RfC is likely to be overly protective, and its use probably results in a moderate to high overestimation (approximately equates to an order of magnitude) of potential for noncarcinogenic risk.

EPA has medium confidence in the RfC value for PCE. Although EPA's confidence in the evidence of neurotoxicological hazard is high, EPA has medium rather than high confidence in the study estimates on which RfCs were based because those estimates were derived from a LOAEL rather than a NOAEL, and data were insufficient for dose-response modeling. Additionally, the studies focused on occupational subjects and lacked data to characterize potential susceptibility and variability across humans. EPA has medium confidence in the database due to limitations in both the available human and animal databases.

3.4 RISK CHARACTERIZATION UNCERTAINTIES

Risk characterization represents the integration of hazard and exposure information to determine the level of risk. Uncertainty in the risk characterization is a compendium of all the previous uncertainties (relating to data reduction, COPC selection, and the exposure and toxicity assessments). Significant site-specific uncertainties associated with the risk characterization not previously noted in discussion of uncertainty for either the exposure or toxicity assessments include:

- The inhalation risk equations are not adjusted for body weight and possible changes in inhalation rate. In this manner, a direct comparison to lifetime "acceptable" concentrations (reference concentrations) is possible, given adjustment for the fraction of a lifetime for which exposure occurred. Because of scientific limitations, this approach (despite its own inherent uncertainty) was determined to be the most conservative yet accurate approach for the inhalation pathway.
- The exposure assessment used readily available, standardized RME parameters wherever possible, and cited heavily from EPA guidance (EPA 1989, 1991a, 2012). These estimates are expected to conservatively over predict risks for most people.

3.5 UNCERTAINTY SUMMARY

Lack of samples representing potential temporal variations in PCE concentrations within indoor air at the houses represents the largest source of uncertainty in the risk assessment, and potentially underestimates risk to occupants.

Overall, conservative measures were used to address the uncertainties in the SLHHRA; thus, the SLHHRA is expected to overestimate actual risks to receptors within the VI area of concern.

4 SUMMARY AND CONCLUSIONS

None of the houses in the quantitative evaluation had an estimated potential cancer risk exceeding the 1E-04 action level. Twenty-two of the 45 houses evaluated had estimated potential cancer risk within the risk management range (1E-06 to 1E-04); however, none the estimated risks exceeded 5E-06, and nine houses were equivalent to the low end of the range at 1E-06. Twenty-three houses had estimated potential cancer risks of less than 1E-06. Cancer risk from VI to indoor air is considered negligible within these houses.

No houses in the quantitative assessment had an estimated noncancer hazard (HI) exceeding the action level of 1. One house had an HI=1. All other houses within the VI area of concern had an estimated noncancer hazard (HI) less than 1, and thus were below a level of concern for non-cancer hazards from VI to indoor air.

One house (at Broadbent ID 985) had an estimated cancer hazard equal to 5E-06 and an HI equal to 1. This house was not sampled by Tetra Tech in 2012 (ID 1626). The measured indoor air concentration of PCE at this house in 2007-2008 was 43 µg/m^3, exceeding the interim action level of 32 µg/m^3 established by NDEP. This house is eligible for installation of an SSD system; however, the homeowner has refused the installation. Installation of an SSD system would reduce the potential cancer risk and noncancer hazard estimated for this house below a level of concern.

Owners/residents of 33 parcels within the VI area of concern have been offered indoor air sampling but, to date, these houses have not undergone sampling because the owners/residents have not consented. Assuming the highest detected concentrations would be found within those houses, the estimated cancer risk is 3E-05 and the estimated non-cancer hazard (HI) is 7. These estimated values have a very high level of uncertainty. Potential for vapor intrusion is based on many site-specific factors including underground conditions, soil properties, and building properties. In general, houses situated above higher concentrations of PCE in groundwater are more likely to be at risk from vapor intrusion. Indoor air sampling is necessary to quantitatively assess the risk at any individual property above the plume.

Use of a single sample result for estimating risk and lack of samples representing potential temporal variations in PCE concentrations within indoor air at the houses represent the largest sources of uncertainty in the risk assessment.

1 INTRODUCTION

Preliminary corrective action objectives (CAO) and preliminary numerical remediation goals protective of human health and the environment were used to guide the evaluation of potential corrective actions for the Site. The preliminary CAOs and numerical remediation goals were established to address site-specific chemicals of concern (COCs), affected media, and potential exposure pathways. The following sections present the proposed CAOs and numerical remediation goals for groundwater at the Maryland Square PCE site. CAOs and numerical remediation goals become final when the corrective action is selected in the Record of Decision for the Site.

1.1 CORRECTIVE ACTION OBJECTIVES

The following CAOs address potential risks to human health and the environment, and are consistent with NAC and Adopted Regulation R189-08:

1. Protect human health by reducing inhalation exposure to PCE and daughter products emanating from groundwater containing PCE concentrations above the remediation goals.
2. Remediate shallow groundwater where PCE concentrations exceed the remediation goal for groundwater.

Intervention to relieve health risk concerns in the residential area is a priority and relevant objective of the corrective action. For this reason, corrective actions focus on the interruption of PCE migration and remediation of groundwater quality beneath the downgradient residential area. Therefore, the point of compliance for these CAOs and the remediation goals is the area immediately upgradient, or the western border, of the Paradise Palms neighborhood.

1.2 REMEDIATION GOALS FOR GROUNDWATER

PCE is the primary COC at the Maryland Square PCE Site. Two daughter products of PCE, TCE and vinyl chloride, have also been detected in a few indoor air samples collected from houses in the residential area. The PCE daughter product cis-1,2-DCE has not been detected in indoor air, but has been detected at low levels in some groundwater samples. However, cis-1,2-DCE does not have toxicity values; thus a remediation goal cannot be calculated for cis-1,2-DCE. Volatilization of contaminants from the groundwater and the subsequent transport of these vapors into indoor spaces represent a potentially complete exposure pathway via the inhalation of contaminated indoor air.

The development of a numerical remediation goal involves four steps:

1. Identification of potentially applicable regulatory standards promulgated under Nevada Administrative Code (NAC) 445A.226, et seq., as amended under Adopted Regulation R189-08, that contain health or risk-based numerical values or requirements.
2. Calculation of risk-based concentrations in the absence of promulgated regulatory standards.
3. Identification of laboratory practical quantitation limits (PQL).

4. Comparison of the concentrations identified through the previous steps.

The first step identified potential regulatory standards potentially applicable to a release to groundwater from a property. Groundwater is "waters of the state," (NRS 445A.415) and NDEP asserts that regulations require "no degradation" of waters of the state (NDEP 2011a). However, Section 14 of Revised Proposed [and adopted] Regulation R189-08, issued by the NDEP Bureau of Corrective Actions, prescribes the criteria required to conclude corrective action activity, that relies, in part, on source control; interruption to, or remediation of, exposure pathways; and the likely use of groundwater.

NAC 445A.22735 establishes action levels for groundwater. These groundwater action levels are either maximum contaminant levels (MCL) established under the Safe Drinking Water Act, (and adopted by reference at NAC 445A.22735(1)(b)), or background concentrations if background levels exceed the MCL. MCLs promulgated under the Safe Drinking Water Act are standards applicable to public water supplies at the point of end use. An MCL, or other drinking water standard, is not appropriate for the shallow groundwater at the Site because shallow groundwater is not used as a domestic water supply and naturally occurring shallow groundwater quality is so poor it is not a potential source of drinking water.

The second step in development of remediation goals identifies potential site-specific, risk-based concentrations. NDEP's interim action level of 32 $\mu g/m^3$ for PCE in indoor air is a risk-based concentration protective of residential exposure to PCE in indoor air corresponding to a cancer risk level of 1 in ten thousand (1E-04) based on the toxicity values for PCE used prior to February 10, 2012. Risk-based concentrations are typically calculated in the absence of promulgated regulatory requirements for protection of a particular receptor or exposure pathway in a given medium. Risk-based concentrations for groundwater were calculated for groundwater exposure pathways identified as complete or potentially complete in the SLHHRA. The only complete or potentially complete exposure pathway identified in the SLHHRA is vapor migration from contaminants in groundwater to indoor air, resulting in potential inhalation of contaminant vapors in indoor air. The only receptor of concern is the resident.

An increased incidence of cancer less than 1 in one million (1E-06) and a noncancer hazard index of less than 1 are considered protective for long-term exposure to contaminants. These values are also considered the point-of-departure dictating corrective action, and are the basis for the RSLs. Calculation of risk-based concentrations in groundwater protective of indoor air concentrations at a target cancer risk of 1E-06 and noncancer hazard index of 1 are necessary to establish the remediation goals for groundwater at the Site.

The third step to establish remediation goals is consideration of laboratory PQLs. The PQL is the lowest concentration that can be reliably measured within specified limits of precision and accuracy by individual analytical methods under routine laboratory conditions. Numeric remediation goals cannot be set below the laboratory PQL because concentrations lower than the PQL cannot be reliably measured. If the risk-based concentration is below analytical PQLs, the PQL will supersede the risk-based concentration as the remediation goal. Laboratory PQLs are low enough to detect PCE, TCE and

vinyl chloride concentrations in groundwater associated with an indoor air inhalation risk level of 1E-06 and non-cancer hazard index equal to 1, thus further consideration of PQLs is not necessary.

The final step in remediation goal development compares the values generated by the previous three steps. The groundwater action levels based on consumption or domestic use of groundwater are not appropriate for the shallow groundwater at the Site, because shallow groundwater is not used as a domestic water supply and naturally occurring shallow groundwater quality is so poor it is not a potential source of drinking water. There are no promulgated action levels for contaminant migration from groundwater to indoor air. PQLs for the COPCs are not a concern because the commonly available analytical methods can accurately detect concentrations below a 1E-06 risk level. Thus, the lower of the risk-based concentrations associated with a 1E-06 cancer risk level or a noncancer hazard index equal to 1 are the appropriate remediation goals for the Site and provide the criterion for design and implementation of the corrective action for the Site.

The remediation goals for groundwater at the Maryland Square PCE Site are based on the potential for vapor intrusion into houses located above the plume of contaminated groundwater. Thus, risk-based groundwater concentrations protective of indoor concentrations were calculated. The remediation goal requires determination of the contaminant concentrations in groundwater that result in indoor air concentration from vapor intrusion that are below a level of concern for the conditions present at the site. The USEPA version of the Johnson and Ettinger (J&E) Model (1991) is able to estimate risk-based groundwater concentrations based on a user-defined target cancer risk and a non-cancer hazard quotient. The USEPA version of the J&E model [GW-ADV-Feb04, Version 3.1 (EPA 2004)] was used to calculate the remediation goal for the site.

The calculated remediation goals for the contaminants of concern are provided in Table 1, discussion of the model assumptions, inputs and uncertainty and sensitivity are provided in the following sections.

Table 1 Remediation Goals for Groundwater at Maryland Square PCE Site

CAS No.	Chemical	Remediation Goal for Groundwater based on Vapor Intrusion Pathway (µg/L)
127184	Tetrachloroethene	276
79016	Trichloroethene	23
75014	Vinyl chloride	5.0

1.2.1 J&E Model Assumptions

The J&E Model incorporates both convective and diffusive mechanisms for estimating the transport of contaminant vapors emanating from groundwater into buildings above the source of contamination. The J&E Model uses a number of assumptions regarding contaminant distribution and occurrence, subsurface characteristics, transport mechanisms, and building construction. Among the J&E Model assumptions are:

- Contamination is homogeneously distributed in the contaminated groundwater.
- Contamination does not undergo chemical or biological transformations between the source and the air.
- Contamination is homogeneously distributed through the indoor air in a house.

1.2.2 J&E Model Inputs

Inputs to the J&E Model include chemical properties of the contaminant, properties of saturated and unsaturated soils, and structural properties of the building. Current USEPA chemical-specific properties and toxicity values (USEPA 2012a) for the COPCs were used in the model. Site-specific parameters (e.g., soil type, average depth to groundwater, average groundwater temperature) were used where available; otherwise, conservative default parameters were used.

Information from the soil boring for monitoring well MW-18 (Figure 1) was used as the basis for site-specific soil type, average depth to groundwater, and average groundwater temperature. This well was selected because, historically, it has shown the highest PCE concentrations in groundwater underlying the residential area, as well as the shallowest depth to groundwater in the residential area.

The boring log for MW-18 and geologic cross section for the site are not completely consistent. The cross section (Figure 2) was used for identifying the soil strata, because it resulted in more protective assumptions for soil type. The input parameters used in the J&E model to calculate the remediation goals, along with the rationale for selection of the inputs, are provided in Table 2. Attachment 1 provides the J&E Model output and the supporting materials for input parameter selection.

1.2.3 Uncertainties in the Remediation Goal

The primary uncertainty in the J&E Model is the assumption that chemical concentrations in groundwater are not decreased by transport of the chemical to the surface. The J&E Model ignores attenuating factors, such as hydrolysis, photolysis, and biological degradation that reduce the contaminant concentration migrating to indoor air. For these reasons, the model serves as a protective screening tool for assessing potential indoor air concentrations and risks.

In addition, the J&E Model is not able to account for spatial variability in the concentrations of subsurface vapors, caused by heterogeneities in the subsurface materials and other factors such as preferential pathways that can result in spatial variability in indoor air concentrations. Additionally, the

Table 2 Remediation Goal J&E Model Input Parameters and Rationale for Selection of Parameter

Parameter Name	Parameter Abbreviation	Value	Units	Rationale	Source
Groundwater temperature	T_S	24.7	°C	Average temperature of groundwater samples collected May 2005 to March 2013.	Cardno 2013
Distance below grade to bottom of enclosed space floor	L_F	15	cm	Default for slab-on-grade construction	USEPA 2004
Depth below grade to water table	L_{WT}	367	cm	Average depth to groundwater from samples collected May 2005 to March 2013.	Cardno 2013
Thickness of soil stratum A	h^A	203	cm	Thickness of upper layer above estimated capillary fringe of 163 cm. Model requires that Stratum A be less than the distance between the water table and the top of the estimated capillary fringe.	Tetra Tech 2011 and USEPA 2004
Thickness of soil stratum B	h^B	164	cm	Thickness of second soil layer between top of capillary fringe (estimated at 163 cm) to top of water table.	Tetra Tech 2011
Soil stratum directly above water table	--	B	--	Stratum B is above water table.	Tetra Tech 2011
SCS soil type directly above water table	--	SI	--	Soil type above water table is silt.	Tetra Tech 2011
Stratum A SCS Soil Type	--	S	--	Sand based on upper layer near MW-18.	Tetra Tech 2011
Stratum A soil dry bulk density	ρ_b^A	1.66	g/cm^3	Default for sand	USEPA 2004
Stratum A soil total porosity	n^A	0.375	unitless	Default for sand	USEPA 2004
Stratum A soil water-filled porosity	θ_w^A	0.054	cm^3/cm^3	Default for sand	USEPA 2004
Stratum B SCS soil type	--	SI	--	Silt based on second layer below asphalt near MW 18.	Tetra Tech 2011

Parameter Name	Parameter Abbreviation	Value	Units	Rationale	Source
Stratum B soil dry bulk density	ρ_b^B	1.35	g/cm^3	Default for silt	USEPA 2004
Stratum B soil total porosity	n^B	0.489	unitless	Default for silt	USEPA 2004
Stratum B soil water-filled porosity	θ_w^B	0.167	cm^3/cm^3	Default for silt	USEPA 2004
Enclosed space floor thickness	L_{crack}	10	cm	Default for slab-on-grade construction	USEPA 2004
Soil-bldg. pressure differential	ΔP	40	$g/cm\text{-}s^2$	Default	USEPA 2004
Enclosed space floor length	L_B	1000	cm	Default	USEPA 2004
Enclosed space floor width	W_B	1000	cm	Default	USEPA 2004
Enclosed space height	H_B	244	cm	Default for slab-on-grade construction	USEPA 2004
Floor-wall seam crack	WB	0.1	cm	Default	USEPA 2004
Indoor air exchange rate	ER	0.25	1/hr	Default	USEPA 2004
Averaging time for carcinogens	AT_C	70	yrs	Default for lifetime exposure	USEPA 1996
Averaging time for non-carcinogens	AT_{NC}	30	yrs	Default	USEPA 1996
Exposure duration	ED	30	yrs	Default	USEPA 1996
Exposure frequency	EF	350	days/year	Default	USEPA 1996
Target risk for carcinogens	TR	1E-06	unitless	Default	
Target hazard quotient for non-carcinogens	THQ	1	unitless	Default	

model is not able to adjust for building-specific characteristics or occupants' activities that affect building ventilation, further adding uncertainty associated with temporal variability in indoor air concentrations. These factors could result in the model over- or underestimating the actual attenuation factor between the subsurface concentration and the indoor air concentration.

The toxicological uncertainties primarily relate to the methodology by which inhalation unit risk and reference concentrations are developed. In general, the methodology currently used to develop inhalation unit risk and reference concentrations is conservative and likely results in an overestimation of human toxicity (USEPA 1989). Thus, the use of these toxicity values in calculation of the remediation goal for groundwater is also protective.

1.2.4 Model Sensitivity to Selected Input Parameters

The results of the J&E Model, and in this case the remediation goals for groundwater, vary dependent on the input parameters used in the model. The site-specific inputs used to calculate the remediation

goal include soil type, depth to groundwater and groundwater temperature. The input parameters from MW-18 were selected as the site-specific input parameters because of this well's historically higher PCE concentrations and shallow groundwater level, which are expected to result in a protective (lower) remediation goal. In addition, MW-18 has sand as the soil type adjacent to the building foundation. Building parameters were held constant at default values because site-specific building parameters are not available. Table 3 presents the changes in input parameters and calculated remediation goal for PCE to demonstrate the J&E Model's sensitivity to the range of site-specific input parameters. Attachment 2 provides the J&E Model data enter table and results for the scenarios evaluated.

Table 3 Sensitivity of Calculated Risk-based Groundwater Concentration to Input Parameters

Scenario	Soil Type	Depth to Groundwater (cm)	Groundwater Temperature (°C)	Risk-based Groundwater Concentration (µg/L)	Change in Value
MW-18 averages (Remediation Goal)	Sand/Silt	367	24.7	276	--
MW-18 averages, change in soil type	Silt/Silt	367	24.7	317	+15%
MW-18 averages, minimum depth to groundwater	Sand/Silt	266	24.7	274	-1%
MW-18 averages, maximum groundwater temperature	Sand/Silt	367	29.3	221	-20%
MW-25 averages (well closest to highest indoor air concentrations)	Silt/Silt	582	24.0	338	+22%
All MWs within 100 µg/L groundwater contaminant plume in residential area, averages (except MW-18 soil type)	Sand/Silt	515	24.0	290	+5%

Notes:
cm – centimeter
°C – degrees Celsius
µg/L – micrograms per liter
% - percent

1.2.4.1 Soil Type

The J&E Model assumes that soil homogeneous in any horizontal plane and that the stratigraphy does not influence flow direction (i.e., vapors flow upward). The model allows up to three soil layers to be included. The soil properties are very important in calculating the vapor flow from the soil to the building. Soil moisture parameters are of critical importance for the calculations. Soil moisture

parameters are calculated by the model based on the soil type selected. Conservative inputs have been estimated or inferred from available data for soil types. The use of sand in the uppermost soil layer is a protective assumption because selection of sand results in properties which are more likely to result in higher levels of vapor intrusion to a house. Replacing the soil type with silt is potentially supported based upon the MW-18 boring log. Use of silt as the upper soil layer results in a calculated remediation goal of 317 µg/L, a 17% higher value than when sand is used as the soil type.

1.2.4.2 Depth to Groundwater

Because the J&E Model assumes the depth to groundwater remains constant, the most appropriate depth to groundwater is an average value. At MW-18 there is depth to groundwater data collected over the course of 8 years. The shallowest depth to groundwater was observed during the first sampling event. Since that time, the depth to groundwater has increased. Insertion of the smallest depth to groundwater (worst case) equal to 8.71 feet into the model, keeping everything else constant, resulted in a 1% percent decrease in the calculated remediation goal to 274 µg/L. Thus, depth to groundwater, in the range observed in the residential area, does not greatly affect the calculated risk-based remediation goal.

1.2.4.3 Groundwater Temperature

The input for groundwater temperature for the J&E Model is used to correct the chemical-specific Henry's Law constant. Insertion of the highest groundwater temperature (worst case) of 29.3°C into the model, keeping everything else constant, results in a remediation goal of 221 µg/L, a 22% percent decrease in the calculated remediation goal. This groundwater temperature input is specifically indicated to be an average temperature in the USPEA version of the model (USPEA 2004). The average groundwater temperature for all wells in the residential area (MW-18, -23, -25, -26, -27, -32, -36, and -39) over the 8 years of data is 24°C, while the average temperature at MW-18 is 24.7°C. Use of the highest groundwater temperature is not representative of long-term site conditions, and is thus not an appropriate value to assess long-term exposure to groundwater contaminants migrating to indoor air.

1.2.4.4 Use of Site-specific Parameters from MW-25

As a comparison, input parameters from MW-25 were used in the J&E Model to calculate a remediation goal. MW-25 is the closest monitoring well to the highest indoor air concentration measure and is closer to the majority of houses that exceed the indoor air action level than MW-18. The soil type at MW-25 is silt from the surface to the groundwater table, the average depth to groundwater at MW-25 is 19 feet, and the average groundwater temperature is 24.0 °C. When based on the site-specific input parameters from MW-25, the calculated remediation goal for PCE is 338 µg/L. This remediation goal is 22% higher (less protective) than the remediation goal calculated using input parameters from MW-18. This result is primarily due to the soil type present at MW-25 versus that at MW-18. Thus, while indoor air concentrations are higher nearer MW-25, the inputs from this monitoring well result in a less protective remediation goal.

1.2.4.5 Use of Average Values from all Monitoring Wells above the 100 µg/L Groundwater Contamination Plume in the Residential Area

Exposure to the groundwater contaminants migrating to indoor air occurs over the course of many years, thus average concentrations are the most representative of potential exposures. The 100 µg/L PCE groundwater contour has been used to identify the houses in the area of concern for vapor intrusion. Averaging the depth to groundwater and temperature inputs from all the monitoring wells within the 100 µg/L PCE groundwater contour in the residential area (MW-18, -23, -25, -26, -27, -32, -36, and -39) and using these values in the J&E Model with the soil types/depths from MW-18 results in a remediation goal of 290 µg/L. This value is 5% higher (less protective) than the remediation goal calculated using MW-18 for the site-specific input parameters.

Subject: RemOx® S ISCO Reagent Permanganate Natural Oxidant Demand

Summary
The overall average RemOx® S ISCO reagent permanganate natural oxidant demand (PNOD) at 48 hours for the two soil samples was determined to be 0.40 g/kg. The average demands ranged from 0.22 g/kg to 0.54 g/kg. These values are calculated on a weight as potassium permanganate ($KMnO_4$) per dry weight of soil.

Background
Two soil samples were received from Tetra Tech, Inc. from the MSSC Site project located in Las Vegas, NV on July 24, 2012. The soil sample designations were TTEW201PNOD3059, and TTMW4001PNOD2955. The samples were analyzed for permanganate natural oxidant demand. The measurement of the permanganate natural oxidant demand is used to estimate the concentration of permanganate that will be consumed by the natural reducing agents during a given time period of 48 hours.

Experimental
The samples were analyzed for permanganate natural oxidant demand following ASTM D7262-07 Test Method A. A brief summary is as follows:

To determine the PNOD, the soil was baked at 105°C for 24 hours then allowed to cool to room temperature. The soil was then blended and passed through a U.S. 10 sieve (2 mm). Reactors were loaded with 50 grams of soil and 100 mL of 20 g/L $KMnO_4$ for an initial dose of 40 g/kg $KMnO_4$ on a dry soil weight basis at a 1:2 soil to aqueous reagent ratio. Each soil dose was performed in triplicate. The reaction vessels were inverted once to mix the reagents. Residual permanganate (MnO_4^-) was determined at 48 hours. The demands were calculated on a dry weight basis.

Results
The permanganate demand is the amount of permanganate consumed in a given amount of time. It should be noted that in a soil or groundwater sample, the oxidation of any compound by permanganate is dependent on the initial dose of permanganate and the reaction time available. As the permanganate dose is increased, the reaction rate and oxidant consumption may also

increase. Some compounds that are not typically oxidized by permanganate under low doses can become reactive with permanganate at higher concentrations.
The 48-hour PNOD results can be seen in Table 1 (on a dry soil basis).

Table 1: 48-Hour PNOD *

Soil Sample Identification	Average and Standard Deviation (g/kg)	Replicate 1 (g/kg)	Replicate 2 (g/kg)	Replicate 3 (g/kg)
TTEW201PNOD3059	0.35 ± 0.17	0.29	0.22	0.54
TTMW4001PNOD2955	0.45 ± 0.08	0.52	0.37	0.47
Overall Average	0.40			

*Demands were calculated on a weight $KMnO_4$/dry soil weight basis from an initial dose of 40.0 g/kg $KMnO_4$ initial dose at a 1:2 soil to aqueous solution ratio

Conclusions
For this application the amount of permanganate needed will be dependent on the reaction time allowed. On average, the soil samples had a 48-hour permanganate demand value of 0.40 g/kg. The average demands ranged from 0.22 g/kg to 0.54 g/kg. Generally, remediation sites with a soil demand of less than 20.0 g/kg at the time of interest are favorable for *in situ* chemical oxidation with permanganate (see Table 2 for additional information).

Table 2: Correlation of Permanganate Natural Oxidant Demand Results*

PNOD (g/kg)	**Rank**	Comment
<10	Low	ISCO with MnO_4^- is recommended. Soil contribution to MnO_4^- demand is low.
10-20	Moderate	ISCO with MnO_4^- is recommended. Soil contribution to MnO_4^- demand is moderate. Economics should be considered.
>20	High	ISCO with MnO_4^- is technically feasible. Other technologies may provide lower cost alternatives.

ONE COMPANY, ENDLESS SOLUTIONS CARUS CORPORATION

REMOX® S ISCO

RemOx® S ISCO reagent has been specifically manufactured for environmental applications such as remediation of soils and associated groundwater. This product can be used to degrade a variety of contaminants including chlorinated solvents, polyaromatic hydrocarbons, phenolics, organo-pesticides, and substituted aromatics. RemOx S is shipped with a certificate of analysis (COA) to document assay and trace metals.

CHEMICAL/PHYSICAL DATA
Formula $KMnO_4$
Formula Weight 158.0 g/mol
Form Granular Crystalline
Specific Gravity
Solid 2.703 g/cm^3
3% Solution 1.020 g/mL by weight, 20° C / 4° C
Bulk Density Approximately 100 lb/ft^3
Decomposition may start at 150° C / 302° F

DESCRIPTION
Crystals or granules are dark purple with a metallic sheen, sometimes with a dark bronze-like appearance. RemOx S has a sweetish, astringent taste and is odorless.

HANDLING, STORAGE, AND INCOMPATIBILITY
Protect containers against physical damage. When handling RemOx S respirators should be worn to avoid irritation of, or damage to, mucous membranes. Eye protection should also be worn when handling RemOx S as a solid or in solution.

RemOx S is stable and will keep indefinitely if stored in a cool, dry area in closed containers. Concrete floors are preferred to wooden decks. To clean up spills and leaks, follow the steps recommended in the MSDS. Be sure to use goggles, rubber gloves, and respirator when cleaning up a spill or leak.

Avoid contact with acids, peroxides, and all combustible organic or readily oxidizable materials including inorganic oxidizable materials and metal powders. With hydrochloric acid, chlorine gas is liberated. RemOx S is not combustible, but it will support combustion. It may decompose if exposed to intense heat.

Fires may be controlled and extinguished by using large quantities of water. Refer to the MSDS for more information.

SHIPPING
RemOx S is classified by the Hazardous Materials Transportation Board (HMTB) as an oxidizer. It is shipped under Interstate Commerce Commission's (ICC) Tariff 19.

Proper Shipping Name: Potassium Permanganate
(RQ-100/45.4)
Hazard Class: Oxidizer
Identification Number: UN 1490
Label Requirements: Oxidizer
Packaging Requirements: 49 CFR Parts 100 to 199
Sections: 173.152, 173.153, 173.194
Shipping Limitations:
Minimum quantities:
Rail car: See Tariff for destination
Truck: No minimum
Postal regulations:
Information applicable to packaging of oxidizers for shipment by the U.S. Postal Service to domestic and foreign destinations is readily

available from the local postmaster. United Parcel Service accepts 25 lbs as largest unit quantity properly packaged; (consult United Parcel Service). Regulations concerning shipping and packing should be consulted regularly due to frequent changes.

CORROSIVE PROPERTIES

RemOx S is compatible with many metals and synthetic materials. Natural rubbers and fibers are often incompatible. Solution pH and temperature are also important factors. The material must be compatible with either the acid or alkali also being used.

In neutral and alkaline solutions, RemOx S is not corrosive to iron, mild steel, or stainless steel; however, chloride corrosion of metals may be accelerated when an oxidant such as permanganate is present in solution. Plastics such as polypropylene, polyvinyl chloride Type I (PVC I), epoxy resins, fiberglass reinforced plastic (FRP), Penton, Lucite, Viton A, and Hypalon are suitable. Teflon FEP and TFE, and Tefzel ETFE are best. Refer to Material Compatibility Chart.

Aluminum, zinc, copper, lead, and alloys containing these metals may be (slightly) affected by RemOx S solutions. Actual studies should be made under the conditions in which permanganate will be used.

APPLICATIONS

RemOx S is used for soil and groundwater remediation by *in situ* or *ex situ* chemical oxidation and as an active agent in subsurface reactive barriers for treatment of: chlorinated ethenes, phenolic compounds, polyaromatic hydrocarbons, TNT, RDX, HMX, and various pesticides.

RE: Maryland Square Shopping Center, 103P172828

Attention: Rob Manriquez

Enclosed are the results for sample(s) received on January 14, 2013 by Advanced Technology Laboratories, Inc. . The sample(s) are tested for the parameters as indicated in the enclosed chain of custody in accordance with the applicable laboratory certifications.

I hereby certify that all laboratory analysis requested were performed by Nevada Division of Environmental Protection-certified laboratory for the parameters and matrices reported herein.

Thank you for the opportunity to service the needs of your company.Please feel free to call me at (702) 307-2659 if I can be of further assistance to your company.

Jose Tenorio Jr.
Laboratory Director

CLIENT: Tetra Tech
Project: Maryland Square Shopping Center, 103P172828
Lab Order: N009334

CASE NARRATIVE

SAMPLE RECEIVING/GENERAL COMMENTS:

Samples were received intact with proper chain of custody documentation.

Cooler temperature and sample preservation were verified upon receipt of samples if applicable.

Information on sample receipt conditions including discrepancies can be found in attached Sample Receipt Checklist Form.

Samples were analyzed within method holding time.

Analytical Comments for EPA 8260B:

Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are outside recovery criteria for some analytes for QC samples N009357-001AMS and N009357-001AMSD possibly due to matrix interference. The associated Laboratory Control Sample (LCS) recovery was acceptable.

Laboratory Control Sample (LCS) and Laboratory Control Sample Duplicate (LCSD) recovery biased high for some analytes. Sample results were non-detect (ND) for these analytes therefore reanalysis of the samples was not necessary.

Special Instructions/Comments:

Sample/Records - Archival & Disposal
Unless otherwise requested by client, all samples will be disposed 45 days after receipt and records will be disposed 1 year after submittal of final report.

Storage Fees (applies when storage is requested):
- Sample : $2.00 / sample / mo (after 45 days)
- Records : $1.00 / ATL workorder / mo (after 1 year)

RE: Maryland Square Shopping Center, 103P172828

Attention: Rob Manriquez

Enclosed are the results for sample(s) received on January 17, 2013 by Advanced Technology Laboratories, Inc. . The sample(s) are tested for the parameters as indicated in the enclosed chain of custody in accordance with the applicable laboratory certifications.

I hereby certify that all laboratory analysis requested were performed by Nevada Division of Environmental Protection-certified laboratory for the parameters and matrices reported herein.

Thank you for the opportunity to service the needs of your company.Please feel free to call me at (702) 307-2659 if I can be of further assistance to your company.

Sincerely,

Jose Tenorio Jr.
Laboratory Director

CLIENT: Tetra Tech
Project: Maryland Square Shopping Center, 103P172828.
Lab Order: N009385

CASE NARRATIVE

SAMPLE RECEIVING/GENERAL COMMENTS:

Samples were received intact with proper chain of custody documentation.

Cooler temperature and sample preservation were verified upon receipt of samples if applicable.

Information on sample receipt conditions including discrepancies can be found in attached Sample Receipt Checklist Form.

Samples were analyzed within method holding time.

Analytical Comments for EPA 8260B:

Laboratory Control Sample (LCS) recovery biased high for some analytes. Sample results were non-detect (ND) for these analytes therefore reanalysis of the samples was not necessary.

RE: Maryland Square Shopping Center, 103P172828

Attention: Rob Manriquez

Enclosed are the results for sample(s) received on January 18, 2013 by Advanced Technology Laboratories, Inc. . The sample(s) are tested for the parameters as indicated in the enclosed chain of custody in accordance with the applicable laboratory certifications.

I hereby certify that all laboratory analysis requested were performed by Nevada Division of Environmental Protection-certified laboratory for the parameters and matrices reported herein.

Thank you for the opportunity to service the needs of your company.Please feel free to call me at (702) 307-2659 if I can be of further assistance to your company.

Sincerely,

for

Jose Tenorio Jr.
Laboratory Director

CASE NARRATIVE

SAMPLE RECEIVING/GENERAL COMMENTS:

Samples were received intact with proper chain of custody documentation.

Cooler temperature and sample preservation were verified upon receipt of samples if applicable.

Information on sample receipt conditions including discrepancies can be found in attached Sample Receipt Checklist Form.

Samples were analyzed within method holding time.

RE: Maryland Square Shopping Center, 103P172828

Attention: Rob Manriquez

Enclosed are the results for sample(s) received on January 18, 2013 by Advanced Technology Laboratories, Inc. . The sample(s) are tested for the parameters as indicated in the enclosed chain of custody in accordance with the applicable laboratory certifications.

I hereby certify that all laboratory analysis requested were performed by Nevada Division of Environmental Protection-certified laboratory for the parameters and matrices reported herein.

Thank you for the opportunity to service the needs of your company.Please feel free to call me at (702) 307-2659 if I can be of further assistance to your company.

Sincerely,

Jose Tenorio Jr.
Laboratory Director

CLIENT: Tetra Tech
Project: Maryland Square Shopping Center, 103P172828.
Lab Order: N009402

CASE NARRATIVE

SAMPLE RECEIVING/GENERAL COMMENTS:

Samples was received intact with proper chain of custody documentation.

Cooler temperature and sample preservation were verified upon receipt of samples if applicable.

Information on sample receipt conditions including discrepancies can be found in attached Sample Receipt Checklist Form.

Sample was analyzed within method holding time.

Advanced Technology Laboratories, Inc.

RE: Maryland Square Shopping Center, 103P172828

Attention: Rob Manriquez

Enclosed are the results for sample(s) received on January 19, 2013 by Advanced Technology Laboratories, Inc. . The sample(s) are tested for the parameters as indicated in the enclosed chain of custody in accordance with the applicable laboratory certifications.

I hereby certify that all laboratory analysis requested were performed by Nevada Division of Environmental Protection-certified laboratory for the parameters and matrices reported herein.

Thank you for the opportunity to service the needs of your company.Please feel free to call me at (702) 307-2659 if I can be of further assistance to your company.

Sincerely,

Jose Tenorio Jr.
Laboratory Director

CLIENT: Tetra Tech
Project: Maryland Square Shopping Center, 103P172828.
Lab Order: N009411

CASE NARRATIVE

SAMPLE RECEIVING/GENERAL COMMENTS:

Samples were received intact with proper chain of custody documentation.

Cooler temperature and sample preservation were verified upon receipt of samples if applicable.

Information on sample receipt conditions including discrepancies can be found in attached Sample Receipt Checklist Form.

Samples were analyzed within method holding time.

RE: Maryland Square Shopping Center, 103P172828

Attention: Rob Manriquez

Enclosed are the results for sample(s) received on January 22, 2013 by Advanced Technology Laboratories, Inc. . The sample(s) are tested for the parameters as indicated in the enclosed chain of custody in accordance with the applicable laboratory certifications.

Thank you for the opportunity to service the needs of your company.

Please feel free to call me at (702) 307-2659 if I can be of further assistance to your company.

Sincerely,

for Jose Tenorio Jr.
Laboratory Director

CLIENT: Tetra Tech
Project: Maryland Square Shopping Center, 103P172828.
Lab Order: N009420

CASE NARRATIVE

SAMPLE RECEIVING/GENERAL COMMENTS:

Samples were received intact with proper chain of custody documentation.

Cooler temperature and sample preservation were verified upon receipt of samples if applicable.

Information on sample receipt conditions including discrepancies can be found in attached Sample Receipt Checklist Form.

Samples were analyzed within method holding time.

Analytical Comments for EPA 8260B:

Surrogate Dibromofluoromethane recovery was below the laboratory acceptable limit for sample N009420-001. Reanalysis confirms low recovery caused by matrix effect.

RE: Maryland Square

Attention: Rob Manriquez

Enclosed are the results for sample(s) received on January 30, 2013 by Advanced Technology Laboratories, Inc. . The sample(s) are tested for the parameters as indicated in the enclosed chain of custody in accordance with the applicable laboratory certifications.

Thank you for the opportunity to service the needs of your company.

Please feel free to call me at (702) 307-2659 if I can be of further assistance to your company.

Sincerely,

for Jose Tenorio Jr.
Laboratory Director

CLIENT: Tetra Tech
Project: Maryland Square
Lab Order: N009492

CASE NARRATIVE

SAMPLE RECEIVING/GENERAL COMMENTS:

Samples were received intact with proper chain of custody documentation.

Cooler temperature and sample preservation were verified upon receipt of samples if applicable.

Information on sample receipt conditions including discrepancies can be found in attached Sample Receipt Checklist Form.

Samples were analyzed within method holding time.

Attention: Rob Manriquez

Enclosed are the results for sample(s) received on July 27, 2012 by Advanced Technology Laboratories, Inc. . The sample(s) are tested for the parameters as indicated in the enclosed chain of custody in accordance with the applicable laboratory certifications.

Thank you for the opportunity to service the needs of your company.

Please feel free to call me at (702) 307-2659 if I can be of further assistance to your company.

Sincerely,

for Jose Tenorio Jr.
Laboratory Director

CASE NARRATIVE

SAMPLE RECEIVING/GENERAL COMMENTS:

Samples were received intact with proper chain of custody documentation.

Cooler temperature and sample preservation were verified upon receipt of samples if applicable.

Information on sample receipt conditions including discrepancies can be found in attached Sample Receipt Checklist Form.

Samples were analyzed within method holding time.

Analytical Comments for EPA 8260B_ Soil:

Surrogate 1,2-Dichloroethane-d4 for the Matrix Spike Duplicate (N008213-001AMSD) was above recovery limit possibly due to matrix interference. The other surrogates were recovered within control limit.

RE: Maryland Square, 103P172824.01

Attention: Rob Manriquez

Enclosed are the results for sample(s) received on July 27, 2012 by Advanced Technology Laboratories, Inc. . The sample(s) are tested for the parameters as indicated in the enclosed chain of custody in accordance with the applicable laboratory certifications.

Thank you for the opportunity to service the needs of your company.

Please feel free to call me at (702) 307-2659 if I can be of further assistance to your company.

Sincerely,

for

Jose Tenorio Jr.
Laboratory Director

Lab Order: N008214

CASE NARRATIVE

SAMPLE RECEIVING/GENERAL COMMENTS:

Samples were received intact with proper chain of custody documentation.

Cooler temperature and sample preservation were verified upon receipt of samples if applicable.

Information on sample receipt conditions including discrepancies can be found in attached Sample Receipt Checklist Form.

Samples were analyzed within method holding time.

Analytical Comments for EPA 8260B:

Matrix Spike (MS) is outside recovery criteria for cis-1,2-Dichloroethene on QC sample N008204-001AMS possibly due to matrix interference. The associated Laboratory Control Sample (LCS) recovery was acceptable.

Result for Tetrachloroethene on sample N008214-004 was reported even if result was outside the calibration range for there was not enough sample for re-analysis.

Please review the checklist below. Any NO signifies non-compliance. Any non-compliance will be noted and must be understood as having an impact on the quality of the data. All tests will be performed as requested regardless of any compliance issues.

If you have any questions or further instruction, please contact our Project Coordinator at (702) 307-2659.

Cooler Received/Opened On:	7/27/2012	Workorder:	N008214
Rep sample Temp (Deg C):	4.2	IR Gun ID:	1
Temp Blank:	☐ Yes ☑ No		
Carrier name:	ATL		
Last 4 digits of Tracking No.:	na	Packing Material Used:	None
Cooling process:	☑ Ice ☐ Ice Pack ☐ Dry Ice ☐ Other ☐ None		

Sample Receipt Checklist

1. Shipping container/cooler in good condition?	Yes ☑	No ☐	Not Present ☐
2. Custody seals intact, signed, dated on shippping container/cooler?	Yes ☐	No ☐	Not Present ☑
3. Custody seals intact on sample bottles?	Yes ☐	No ☐	Not Present ☑
4. Chain of custody present?	Yes ☑	No ☐	
5. Sampler's name present in COC?	Yes ☑	No ☐	
6. Chain of custody signed when relinquished and received?	Yes ☑	No ☐	
7. Chain of custody agrees with sample labels?	Yes ☑	No ☐	
8. Samples in proper container/bottle?	Yes ☑	No ☐	
9. Sample containers intact?	Yes ☑	No ☐	
10. Sufficient sample volume for indicated test?	Yes ☐	No ☑	
11. All samples received within holding time?	Yes ☑	No ☐	
12. Temperature of rep sample or Temp Blank within acceptable limit?	Yes ☑	No ☐	NA ☐
13. Water - VOA vials have zero headspace?	Yes ☐	No ☑	NA ☐
14. Water - pH acceptable upon receipt? Example: pH > 12 for (CN,S); pH<2 for Metals	Yes ☐	No ☐	NA ☑
15. Did the bottle labels indicate correct preservatives used?	Yes ☑	No ☐	NA ☐
16. Were there Non-Conformance issues at login?	Yes ☐	No ☐	NA ☑
Was Client notified?	Yes ☐	No ☐	NA ☑

Comments: TT-EW1-04-GW50 has only 1 VOA vial and has bubble.

RE: Maryland Square, 103P172824.01

Attention: Rob Manriquez

Enclosed are the results for sample(s) received on August 06, 2012 by Advanced Technology Laboratories, Inc. . The sample(s) are tested for the parameters as indicated in the enclosed chain of custody in accordance with the applicable laboratory certifications.

Thank you for the opportunity to service the needs of your company.

Please feel free to call me at (702) 307-2659 if I can be of further assistance to your company.

Sincerely,

for

Jose Tenorio Jr.
Laboratory Director

CLIENT: Tetra Tech
Project: Maryland Square, 103P172824.01
Lab Order: N008263

CASE NARRATIVE

SAMPLE RECEIVING/GENERAL COMMENTS:

Samples were received intact with proper chain of custody documentation.

Cooler temperature and sample preservation were verified upon receipt of samples if applicable.

Information on sample receipt conditions including discrepancies can be found in attached Sample Receipt Checklist Form.

Samples were analyzed within method holding time.

Lab Order: N008315

CASE NARRATIVE

SAMPLE RECEIVING/GENERAL COMMENTS:

Samples were received intact with proper chain of custody documentation.

Cooler temperature and sample preservation were verified upon receipt of samples if applicable.

Information on sample receipt conditions including discrepancies can be found in attached Sample Receipt Checklist Form.

Samples were analyzed within method holding time.

Analytical Comments for EPA 8260B:

Laboratory Control Sample Duplicate (LCSD) recovery biased high for 1,1-Dichloroethene . Sample results were non-detect (ND) for this analyte therefore reanalysis was not necessary.

TAT By Friday 8-17-12

Sample/Records - Archival & Disposal
Unless otherwise requested by client, all samples will be disposed 45 days after receipt and records will be disposed 1 year after submittal of final report.

Storage Fees (applies when storage is requested):
- Sample : $2.00 / sample / mo (after 45 days)
- Records : $1.00 / ATL workorder / mo (after 1 year)

Please review the checklist below. Any NO signifies non-compliance. Any non-compliance will be noted and must be understood as having an impact on the quality of the data. All tests will be performed as requested regardless of any compliance issues.

If you have any questions or further instruction, please contact our Project Coordinator at (702) 307-2659.

Cooler Received/Opened On:	8/13/2012	Workorder:	N008315
Rep sample Temp (Deg C):	3.2	IR Gun ID:	2
Temp Blank:	☐ Yes ☑ No		
Carrier name:	ATL		
Last 4 digits of Tracking No.:	na	Packing Material Used:	None
Cooling process:	☑ Ice ☐ Ice Pack ☐ Dry Ice ☐ Other ☐ None		

Sample Receipt Checklist

1. Shipping container/cooler in good condition?	Yes ☑	No ☐	Not Present ☐
2. Custody seals intact, signed, dated on shippping container/cooler?	Yes ☐	No ☐	Not Present ☑
3. Custody seals intact on sample bottles?	Yes ☐	No ☐	Not Present ☑
4. Chain of custody present?	Yes ☑	No ☐	
5. Sampler's name present in COC?	Yes ☑	No ☐	
6. Chain of custody signed when relinquished and received?	Yes ☑	No ☐	
7. Chain of custody agrees with sample labels?	Yes ☑	No ☐	
8. Samples in proper container/bottle?	Yes ☑	No ☐	
9. Sample containers intact?	Yes ☑	No ☐	
10. Sufficient sample volume for indicated test?	Yes ☑	No ☐	
11. All samples received within holding time?	Yes ☑	No ☐	
12. Temperature of rep sample or Temp Blank within acceptable limit?	Yes ☑	No ☐	NA ☐
13. Water - VOA vials have zero headspace?	Yes ☑	No ☐	NA ☐
14. Water - pH acceptable upon receipt? Example: pH > 12 for (CN,S); pH<2 for Metals	Yes ☐	No ☐	NA ☑
15. Did the bottle labels indicate correct preservatives used?	Yes ☑	No ☐	NA ☐
16. Were there Non-Conformance issues at login?	Yes ☐	No ☐	NA ☑
Was Client notified?	Yes ☑ 8/14/12	No ☐	NA ☑

RE: Maryland Square

Attention: Lisa Medve

Enclosed are the results for sample(s) received on August 28, 2012 by Advanced Technology Laboratories, Inc. . The sample(s) are tested for the parameters as indicated in the enclosed chain of custody in accordance with the applicable laboratory certifications.

I hereby certify that all laboratory analysis requested were performed by Nevada Division of Environmental Protection-certified laboratory for the parameters and matrices reported herein.

Thank you for the opportunity to service the needs of your company.Please feel free to call me at (702) 307-2659 if I can be of further assistance to your company.

Sincerely,

Jose Tenorio Jr.
Laboratory Director

CLIENT: Tetra Tech
Project: Maryland Square
Lab Order: N008395

CASE NARRATIVE

SAMPLE RECEIVING/GENERAL COMMENTS:

Sample was received intact with proper chain of custody documentation.

Cooler temperature and sample preservation were verified upon receipt of samples if applicable.

Information on sample receipt conditions including discrepancies can be found in attached Sample Receipt Checklist Form.

Sample was analyzed within method holding time.

Analytical Comments for EPA 8260B:

Laboratory Control Sample (LCS) recovery biased high for 1,2,3-Trichlorobenzene. Sample result was non-detect (ND) for this analyte therefore reanalysis of the sample was not necessary.

RE: Maryland Square

Attention: Lisa Medve

Enclosed are the results for sample(s) received on August 28, 2012 by Advanced Technology Laboratories, Inc. . The sample(s) are tested for the parameters as indicated in the enclosed chain of custody in accordance with the applicable laboratory certifications.

This is an addendum report. Please incorporate with documentation previously submitted.

Thank you for the opportunity to service the needs of your company.

Please feel free to call me at (702) 307-2659 if I can be of further assistance to your company.

Sincerely,

Jose Tenorio Jr.
Laboratory Director

CASE NARRATIVE

Analytical Comments for EPA 6010B:

Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are outside recovery criteria for Calcium possibly due to matrix interference. The associated Laboratory Control Sample (LCS) recovery was acceptable.

Yes, please do. We will be arranging for additional sample collection tomorrow. Thanks.

Subject: RE: MSSC data

The only tests that can be analyzed within holding time from the list are metals and sulfate. Do you still want to proceed?

Thanks,
Glen

Hi Glen,

Are any of these still within the holding time for analysis? If so can you please run them?

Thanks,
LM

Subject: RE: MSSC data
Importance: High

Hi Glen

We just spoke on the phone. Can you please let me know what analyses in addition to 8260B we would need to run for the following list of analytes? The NDEP will not give us a final list of what analyses are required until they see our 8260B and TDS data. We'd like to collect bottles for all of the analyses today and hold all of them except for 8260B, which should be run on 1 day TAT. We'll send the results to NDEP tomorrow and see if they will require any of the other analysis be done; if so we will have the samples collected and ready for analysis.

Also can we get the TDS data for samples N008315 by itself (without the VOC data on the same page)?

Total Residual Chlorine[1] – mg/L
Total Dissolved Solids (TDS) – mg/L

RE: MSSC, 103P172829

Attention: Rob Manriquez

Enclosed are the results for sample(s) received on March 11, 2013 by Advanced Technology Laboratories, Inc. . The sample(s) are tested for the parameters as indicated in the enclosed chain of custody in accordance with the applicable laboratory certifications.

Thank you for the opportunity to service the needs of your company.

Please feel free to call me at (702) 307-2659 if I can be of further assistance to your company.

Sincerely,

for

Jose Tenorio Jr.
Laboratory Director

Lab Order: N009791

CASE NARRATIVE

SAMPLE RECEIVING/GENERAL COMMENTS:

Samples were received intact with proper chain of custody documentation.

Cooler temperature and sample preservation were verified upon receipt of samples if applicable.

Information on sample receipt conditions including discrepancies can be found in attached Sample Receipt Checklist Form.

Samples were analyzed within method holding time.

Analytical Comments for EPA 6020_Dissolved:

Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are outside recovery criteria for Chromium and Manganese possibly due to matrix interference. The associated Laboratory Control Sample (LCS) recovery was acceptable.

Analytical Comments for EPA 8260B_Soil:

Dilution was necessary on composited samples N009791-008, N009791-009, N009791-011 and N009791-012 due to matrix.

Analytical Comments for EPA 8260B_Water:

Laboratory Control Sample (LCS) and Laboratory Control Sample Duplicate (LCSD) recovery bias high for 1,2-Dibromo-3-chloropropane and Bromoform . Sample results were non- detect (ND) for these analytes, therefore reanalysis was not necessary.

Fed Ex #:

* KMnO4 by colorimetric

*IDW - soil samples are composites & should be analyzed as one (1) sample per location (i.e 3 4ounce glass jars for VM1-030613 → 1 analysis of composite)

Advanced Technology Laboratories, Inc.

Please review the checklist below. Any NO signifies non-compliance. Any non-compliance will be noted and must be understood as having an impact on the quality of the data. All tests will be performed as requested regardless of any compliance issues.

If you have any questions or further instruction, please contact our Project Coordinator at (702) 307-2659.

Cooler Received/Opened On:	3/11/2013	Workorder:	N009791
Rep sample Temp (Deg C):	2.6	IR Gun ID:	1
Temp Blank:	☐ Yes ☑ No		
Carrier name:	ATL		
Last 4 digits of Tracking No.:	NA	Packing Material Used:	None
Cooling process:	☑ Ice ☐ Ice Pack ☐ Dry Ice ☐ Other ☐ None		

Sample Receipt Checklist

1. Shipping container/cooler in good condition?	Yes ☑	No ☐	Not Present ☐
2. Custody seals intact, signed, dated on shippping container/cooler?	Yes ☐	No ☐	Not Present ☑
3. Custody seals intact on sample bottles?	Yes ☐	No ☐	Not Present ☑
4. Chain of custody present?	Yes ☑	No ☐	
5. Sampler's name present in COC?	Yes ☑	No ☐	
6. Chain of custody signed when relinquished and received?	Yes ☑	No ☐	
7. Chain of custody agrees with sample labels?	Yes ☑	No ☐	
8. Samples in proper container/bottle?	Yes ☑	No ☐	
9. Sample containers intact?	Yes ☑	No ☐	
10. Sufficient sample volume for indicated test?	Yes ☑	No ☐	
11. All samples received within holding time?	Yes ☑	No ☐	
12. Temperature of rep sample or Temp Blank within acceptable limit?	Yes ☑	No ☐	NA ☐
13. Water - VOA vials have zero headspace?	Yes ☑	No ☐	NA ☐
14. Water - pH acceptable upon receipt? Example: pH > 12 for (CN,S); pH<2 for Metals	Yes ☑	No ☐	NA ☐
15. Did the bottle labels indicate correct preservatives used?	Yes ☑	No ☐	NA ☐
16. Were there Non-Conformance issues at login?	Yes ☐	No ☐	NA ☑
Was Client notified?	Yes ☐	No ☐	NA ☑

RE: Mall at Maryland Square, 103P172829

Attention: Rob Manriquez

Enclosed are the results for sample(s) received on March 12, 2013 by Advanced Technology Laboratories, Inc. . The sample(s) are tested for the parameters as indicated in the enclosed chain of custody in accordance with the applicable laboratory certifications.

Thank you for the opportunity to service the needs of your company.

Please feel free to call me at (702) 307-2659 if I can be of further assistance to your company.

Sincerely,

Jose Tenorio Jr.
Laboratory Director

Lab Order: N009798

CASE NARRATIVE

SAMPLE RECEIVING/GENERAL COMMENTS:

Samples were received intact with proper chain of custody documentation.

Cooler temperature and sample preservation were verified upon receipt of samples if applicable.

Information on sample receipt conditions including discrepancies can be found in attached Sample Receipt Checklist Form.

Samples were analyzed within method holding time.

Analytical Comments for EPA 6010B:

Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are outside recovery criteria for Potassium possibly due to matrix interference. The associated Laboratory Control Sample (LCS) recovery was acceptable.

Analytical Comments for EPA 6020:

Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are outside recovery criteria for Chromium and Manganese possibly due to matrix interference. The associated Laboratory Control Sample (LCS) recovery was acceptable.

Analytical Comments for EPA 8260B:

Laboratory Control Sample (LCS) recovery biased high for 1,2-Dibromo-3-chloropropane and Bromoform. Sample results were non-detect (ND) for these analytes therefore reanalysis of the samples was not necessary.

Sample Fraction A - clear sample
Sample Fraction D - colored sample

Special Instructions/Comments:
* GW to be analyzed by 8260B was pre-treated w KMnO4 so samples were collected in unpreserved 40 mL VOAs + NaHSO4 were used to stop destruction of VOCs.
*dissolved metals (D) filtered.

Sample/Records-Archival & Disposal
Unless otherwise requested by client, all samples will be disposed 45 days after receipt and records will be disposed 1 year after submittal of final report.

Storage Fees (applies when storage is requested):
- Sample : $ 2.00 / sample / mo (after 45 days)
- Records : $ 1.00 / ATL workorder / mo (after 1 year)

Circle or Add Analysis(es) Requested: 8260B (VOC); 8260B (BTEX), (MTBE); 8015B (GRO); 8015B (DRO), (Motor Oil/ORO); RCRA8 (6010B/7000); Metals dissolved (Mg, Mn, Fe); Permanganate by Potassium and Chloride

RE: Maryland Square, 103P172829.01

Attention: Rob Manriquez

Enclosed are the results for sample(s) received on March 13, 2013 by Advanced Technology Laboratories, Inc. . The sample(s) are tested for the parameters as indicated in the enclosed chain of custody in accordance with the applicable laboratory certifications.

Thank you for the opportunity to service the needs of your company.

Please feel free to call me at (702) 307-2659 if I can be of further assistance to your company.

Sincerely,

Jose Tenorio Jr.
Laboratory Director

CLIENT: Tetra Tech
Project: Maryland Square, 103P172829.01
Lab Order: N009811

CASE NARRATIVE

SAMPLE RECEIVING/GENERAL COMMENTS:

Samples were received intact with proper chain of custody documentation.

Cooler temperature and sample preservation were verified upon receipt of samples if applicable.

Information on sample receipt conditions including discrepancies can be found in attached Sample Receipt Checklist Form.

Samples were analyzed within method holding time.

Attention: Rob Manriquez

Enclosed are the results for sample(s) received on March 27, 2013 by Advanced Technology Laboratories, Inc. . The sample(s) are tested for the parameters as indicated in the enclosed chain of custody in accordance with the applicable laboratory certifications.

Thank you for the opportunity to service the needs of your company.

Please feel free to call me at (702) 307-2659 if I can be of further assistance to your company.

Sincerely,

for Jose Tenorio Jr.
Laboratory Director

Lab Order: N009896

CASE NARRATIVE

SAMPLE RECEIVING/GENERAL COMMENTS:

Samples were received intact with proper chain of custody documentation.

Cooler temperature and sample preservation were verified upon receipt of samples if applicable.

Information on sample receipt conditions including discrepancies can be found in attached Sample Receipt Checklist Form.

Samples were analyzed within method holding time.

Analytical Comments for EPA 6010B:

Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are outside recovery criteria for Manganese possibly due to matrix interference. The associated Laboratory Control Sample (LCS) recovery was acceptable.

Analytical Comments for EPA 8260B:

Laboratory Control Sample (LCS) and Laboratory Control Sample Duplicate (LCSD) recovery bias high for Carbon Tetrachloride and 2,2-Dichloropropane. Sample results were non- detect (ND) for these analytes, therefore reanalysis was not necessary.

Sample/Records-Archival & Disposal
Unless otherwise requested by client, all samples will be disposed 45 days after receipt and records will be disposed 1 year after submittal of final report.

Storage Fees (applies when storage is requested):
- Sample : $ 2.00 / sample / mo (after 45 days)
- Records : $ 1.00 / ATL workorder / mo (after 1 year)

RE: Maryland Square, 103P172829.01

Attention: Rob Manriquez

Enclosed are the results for sample(s) received on March 27, 2013 by Advanced Technology Laboratories, Inc. . The sample(s) are tested for the parameters as indicated in the enclosed chain of custody in accordance with the applicable laboratory certifications.

Thank you for the opportunity to service the needs of your company.

Please feel free to call me at (702) 307-2659 if I can be of further assistance to your company.

Sincerely,

for

Jose Tenorio Jr.
Laboratory Director

CLIENT: Tetra Tech
Project: Maryland Square, 103P172829.01
Lab Order: N009897

CASE NARRATIVE

SAMPLE RECEIVING/GENERAL COMMENTS:

Samples were received intact with proper chain of custody documentation.

Cooler temperature and sample preservation were verified upon receipt of samples if applicable.

Information on sample receipt conditions including discrepancies can be found in attached Sample Receipt Checklist Form.

Samples were analyzed within method holding time.

Analytical Comments for EPA 6020_Dissolved:

Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are outside recovery criteria for Manganese since the analyte concentration in the sample is disproportionate to the spike level. The associated Laboratory Control Sample (LCS) recovery was acceptable.

RE: Maryland Square, 103P172829.01

Attention: Rob Manriquez

Enclosed are the results for sample(s) received on May 02, 2013 by Advanced Technology Laboratories, Inc. . The sample(s) are tested for the parameters as indicated in the enclosed chain of custody in accordance with the applicable laboratory certifications.

Thank you for the opportunity to service the needs of your company.

Please feel free to call me at (702) 307-2659 if I can be of further assistance to your company.

Sincerely,

Jose Tenorio Jr.
Laboratory Director

Lab Order: N010153

CASE NARRATIVE

SAMPLE RECEIVING/GENERAL COMMENTS:

Samples were received intact with proper chain of custody documentation.

Cooler temperature and sample preservation were verified upon receipt of samples if applicable.

Information on sample receipt conditions including discrepancies can be found in attached Sample Receipt Checklist Form.

Samples were analyzed within method holding time.

Analytical Comments for EPA 6010B:

Matrix Spike (MS) and /or Matrix Spike Duplicate (MSD) are outside recovery criteria for Chromium since the analyte concentration in the sample is disproportionate to the spike level. The associated Laboratory Control Sample (LCS) recovery was acceptable.

Analytical Comments for EPA 8260B:

Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are outside recovery criteria for some analytes possibly due to matrix interference. The associated Laboratory Control Sample (LCS) recovery was acceptable.

Sample/Records-Archival & Disposal
Unless otherwise requested by client, all samples will be disposed 45 days after receipt and records will be disposed 1 year after submittal of final report.

Storage Fees (applies when storage is requested):
- Sample : $ 2.00 / sample / mo (after 45 days)
- Records : $ 1.00 / ATL workorder / mo (after 1 year)

Please review the checklist below. Any NO signifies non-compliance. Any non-compliance will be noted and must be understood as having an impact on the quality of the data. All tests will be performed as requested regardless of any compliance issues.

If you have any questions or further instruction, please contact our Project Coordinator at (702) 307-2659.

Cooler Received/Opened On:	5/2/2013	Workorder:	N010153
Rep sample Temp (Deg C):	3.8	IR Gun ID:	1
Temp Blank:	☐ Yes ☑ No		
Carrier name:	ATL		
Last 4 digits of Tracking No.:	N/A	Packing Material Used:	None
Cooling process:	☑ Ice ☐ Ice Pack ☐ Dry Ice ☐ Other ☐ None		

Sample Receipt Checklist

1. Shipping container/cooler in good condition?	Yes ☑	No ☐	Not Present ☐
2. Custody seals intact, signed, dated on shippping container/cooler?	Yes ☐	No ☐	Not Present ☑
3. Custody seals intact on sample bottles?	Yes ☐	No ☐	Not Present ☑
4. Chain of custody present?	Yes ☑	No ☐	
5. Sampler's name present in COC?	Yes ☑	No ☐	
6. Chain of custody signed when relinquished and received?	Yes ☑	No ☐	
7. Chain of custody agrees with sample labels?	Yes ☑	No ☐	
8. Samples in proper container/bottle?	Yes ☑	No ☐	
9. Sample containers intact?	Yes ☑	No ☐	
10. Sufficient sample volume for indicated test?	Yes ☑	No ☐	
11. All samples received within holding time?	Yes ☑	No ☐	
12. Temperature of rep sample or Temp Blank within acceptable limit?	Yes ☑	No ☐	NA ☐
13. Water - VOA vials have zero headspace?	Yes ☑	No ☐	NA ☐
14. Water - pH acceptable upon receipt? Example: pH > 12 for (CN,S); pH<2 for Metals	Yes ☑	No ☐	NA ☐
15. Did the bottle labels indicate correct preservatives used?	Yes ☑	No ☐	NA ☐
16. Were there Non-Conformance issues at login?	Yes ☐	No ☐	NA ☑
Was Client notified?	Yes ☐	No ☐	NA ☑

RE: Maryland Square, 103P172829.01

Attention: Rob Manriquez

Enclosed are the results for sample(s) received on March 26, 2013 by Advanced Technology Laboratories, Inc. . The sample(s) are tested for the parameters as indicated in the enclosed chain of custody in accordance with the applicable laboratory certifications.

Thank you for the opportunity to service the needs of your company.

Please feel free to call me at (702) 307-2659 if I can be of further assistance to your company.

Sincerely,

Jose Tenorio Jr.
Laboratory Director

CLIENT: Tetra Tech
Project: Maryland Square, 103P172829.01
Lab Order: N009889

CASE NARRATIVE

SAMPLE RECEIVING/GENERAL COMMENTS:

Samples were received intact with proper chain of custody documentation.

Cooler temperature and sample preservation were verified upon receipt of samples if applicable.

Information on sample receipt conditions including discrepancies can be found in attached Sample Receipt Checklist Form.

Samples were analyzed within method holding time.

RE: Maryland Square, 103P172829.01

Attention: Rob Manriquez

Enclosed are the results for sample(s) received on May 02, 2013 by Advanced Technology Laboratories, Inc. . The sample(s) are tested for the parameters as indicated in the enclosed chain of custody in accordance with the applicable laboratory certifications.

Thank you for the opportunity to service the needs of your company.

Please feel free to call me at (702) 307-2659 if I can be of further assistance to your company.

Sincerely,

Jose Tenorio Jr.
Laboratory Director

CLIENT: Tetra Tech
Project: Maryland Square, 103P172829.01
Lab Order: N010153

CASE NARRATIVE

SAMPLE RECEIVING/GENERAL COMMENTS:

Samples were received intact with proper chain of custody documentation.

Cooler temperature and sample preservation were verified upon receipt of samples if applicable.

Information on sample receipt conditions including discrepancies can be found in attached Sample Receipt Checklist Form.

Samples were analyzed within method holding time.

Analytical Comments for EPA 6010B:

Matrix Spike (MS) and /or Matrix Spike Duplicate (MSD) are outside recovery criteria for Chromium since the analyte concentration in the sample is disproportionate to the spike level. The associated Laboratory Control Sample (LCS) recovery was acceptable.

Analytical Comments for EPA 8260B:

Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are outside recovery criteria for some analytes possibly due to matrix interference. The associated Laboratory Control Sample (LCS) recovery was acceptable.

Please review the checklist below. Any NO signifies non-compliance. Any non-compliance will be noted and must be understood as having an impact on the quality of the data. All tests will be performed as requested regardless of any compliance issues.

If you have any questions or further instruction, please contact our Project Coordinator at (702) 307-2659.

Cooler Received/Opened On:	5/2/2013	Workorder:	N010153
Rep sample Temp (Deg C):	3.8	IR Gun ID:	1
Temp Blank:	☐ Yes ☑ No		
Carrier name:	ATL		
Last 4 digits of Tracking No.:	N/A	Packing Material Used:	None
Cooling process:	☑ Ice ☐ Ice Pack ☐ Dry Ice ☐ Other ☐ None		

Sample Receipt Checklist

1. Shipping container/cooler in good condition?	Yes ☑	No ☐	Not Present ☐
2. Custody seals intact, signed, dated on shippping container/cooler?	Yes ☐	No ☐	Not Present ☑
3. Custody seals intact on sample bottles?	Yes ☐	No ☐	Not Present ☑
4. Chain of custody present?	Yes ☑	No ☐	
5. Sampler's name present in COC?	Yes ☑	No ☐	
6. Chain of custody signed when relinquished and received?	Yes ☑	No ☐	
7. Chain of custody agrees with sample labels?	Yes ☑	No ☐	
8. Samples in proper container/bottle?	Yes ☑	No ☐	
9. Sample containers intact?	Yes ☑	No ☐	
10. Sufficient sample volume for indicated test?	Yes ☑	No ☐	
11. All samples received within holding time?	Yes ☑	No ☐	
12. Temperature of rep sample or Temp Blank within acceptable limit?	Yes ☑	No ☐	NA ☐
13. Water - VOA vials have zero headspace?	Yes ☑	No ☐	NA ☐
14. Water - pH acceptable upon receipt? Example: pH > 12 for (CN,S); pH<2 for Metals	Yes ☑	No ☐	NA ☐
15. Did the bottle labels indicate correct preservatives used?	Yes ☑	No ☐	NA ☐
16. Were there Non-Conformance issues at login?	Yes ☐	No ☐	NA ☑
Was Client notified?	Yes ☐	No ☐	NA ☑

11. Notes

System had been running consistently since start-up around 4:00 PM on April 3rd, 2013. Cycle times determined based on J. Cresap's instructions. Maximum pump output is 1.3 gpm.

Upper Zone = 2.1 gallons H2O2 four times per day, 2 scfm 50% duty cycle

Lower Zone = 3.2 gallons H2O2 four times per day, 3 scfm 50% duty cycle

Ozone flow rates can not be adjusted on a per-well basis. Each ozone injection point was given 50% duty cycle, but flow rates will be dependent on pressure.

It was determined on 4/5/13 that the H2O2 pump was not staying primed at current settings. Stroke length was adjusted to 70% where the pump performed sufficiently. Injection cycles were changed to 60 minute periods of O3/O2 injection with a 60 minute period of H2O2 injection in the deep well, and a 40 minute period of H2O2 injection in the shallow well. According to APT peronnel, the decrease in time between the hydrogen peroxide injection sequences (20 minutes vs the previous maximum of 83 minutes) would help keep the pump primed.

11. Notes

System had shut down at approximately 14:30 on Sunday, April 7th on an ozone detect alarm on both injection legs (Well 1 and Well 2). The site was reached on the evening of Monday April 8th and restarted. A leak could not be identified, but the air solenoid valve on the Well 2 leg (deep injection point) would not open during system restarts. It was assumed that with the air valve not opening, the leaking ozone was concentrated enough the shut the system down. The deep well ozone and hydrogen peroxide injection lines were switched from Leg 2 of the injection manifold to Leg 3 of the injection manifold. The system restarted and continued operating after the switch.

Data was collected from the system on 4/9/2013 at approximately 9:00 AM. The system had been active since 8:00 PM on 4/8/2013. The 6.5 additional hours added to the hour meter readings for the deep injection points reflect the 13 elapsed hours between when the system was restarted and when the hour meter readings were collected (O3/O2 for 60 minutes, followed by H2O2 for 60 minutes).

A leak was identified in the ozone cabinet at a connection between an electrode and the ozone generating plates. The ozone generator was shut down and a repair was attempted using 2 part epoxy to seal the gap between the ceramic casing on the electrode and a metal hex-nut used to attach it to the plates. During the repair a thermocouple attached to the ozone generator broke loose and could not be reattached. Although the system could run without the thermocouple in place, it would not be thermally protected. It was decided that the system would be left off until 4/10/13 when Mike Eichenmueller would be available to replace the broken thermocouple. The system was restarted on 4/10/13 after repairs had been made in the cabinet.

The system was shut down again on 4/11/13 after it was determined that ozone was short-circuiting up nearby wells SVE-1 and MW-20D1 and MW-20D2.

11. Notes

Upon arrival at site (~11:40), removed PVC plugs used to seal wells SVE-1 and MW-20D1. Not enough thread tape was used on either plug and some threads appeared damaged. Replaced plugs with new "cleanout" style plugs and applied sufficient thread tape.

Restarted system at 12:30. Reduced ozone flowrate and air flowrate from prior setpoints. Ozone flow could only be reduced so far (~15 lpm per leg) before tripping a low flow alarm.

Refilled H2O2 tank.

Replaced missing signs on perimeter fence to maintain permit compliance.

Collected Zone A field readings at 15:00. No elevated O3 readings were detected in MW-20D1 vault or SVE-1 vault.

Small leak detected in ozone generator cabinet in same location as before (electrode). The leak appears to have slowed after the application of the epoxy with a maximum concentration of approximately 0.08 ppm immediately adjacent to the electrode. The ozone meter detected no ozone in the vicinity of the in-cabinet ozone sensor, and no ozone was detected outside of the vent (vents to interior of trailer) on the bottom of the cabinet.

Prior to leaving the site an additional round of ozone monitoring was performed in the vicinity of MW-20D1 and SVE-1. No elevated ozone concentrations were detected in either vault. After consulting with C. Christian, it was decided that the system would be left running.

11. Notes

Upon arrival at site (~9:45), ozone odor was present in trailer. No odor was present outside of trailer, nor was ozone detected at elevated concentrations outside of trailer or in vicinity of monitoring wells.

Ozone leak in the generator cabinet was still present (~0.07 ppm).

H2O2 tank was empty on arrival. Refilled H2O2 tank and restarted injection at approximately 10:15.

Replaced missing signs on perimeter fence to maintain permit compliance.

Collected Zone A field readings at 10:40 AM and Zone B field readings at 11:40 AM.

11. Notes

System was off upon arrival due to groundwater sampling performed the previous day and in preparation for an H2O2/Air sparge ROI test.

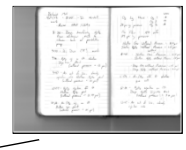
ROI testing was performed between 9:40 AM and 14:40 PM. See attached field notes for testing sequence details.

H2O2 tank was filled using peristaltic pump. Exterior tanks were completely emptied.

Replaced missing signs on perimeter fence to maintain permit compliance.

Normal system operations were resumed at 14:55.

Injection sequence was manually advanced at 15:35 to collect Zone B system readings.



Double-click to open field notes for ROI test.

11. Notes

System was off on arrival due to low level alarm in hydrogen peroxide tank. Injection pump was run briefly (~ 1 hour) to inject remaining quantity of H2O2.

Well heads/lines were removed, plugs were threaded into injection wells, and the well vault cover was replaced.

System trailer, chemical storage tanks, and containment berm were removed on 5/8/2013.
