Carson City, Nevada 89701-5249

SUBJECT: FINAL SITE MANAGEMENT PLAN, NAVAL AIR STATION FALLON,  
FALLON, NEVADA

Dear Mr. Smale,

Provided for your information is the final version of the Site Management Plan (SMP) for Naval Air Station (NAS) Fallon.

This SMP was developed to guide environmental restoration activities of the U.S. Department of the Navy under the Defense Environmental Restoration Program (DERP), the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA), and the National Oil and Hazardous Substances Pollution Contingency Plan (NCP). The SMP covers the status, management, response strategy, and action items related to these environmental restoration activities.

Please call me at (619)-532-4176 if you have any questions regarding this submittal.

Sincerely,

A handwritten signature in black ink, appearing to read "R. Michael Quesada", is written over a horizontal line.

R. MICHAEL QUESADA  
Lead Remedial Project Manager  
By direction of the  
Commanding Officer

Enclosure: Final Site Management Plan, Naval Air Station  
Fallon, Fallon, Nevada, prepared by Tetra Tech EM  
Inc., under NUS CLEAN contract N62467-04-D-0055,  
Delivery Order 0300, dated March 2011.

## 1.0 INTRODUCTION

Naval Air Station (NAS) Fallon developed this Site Management Plan (SMP) to guide environmental restoration activities of the U.S. Department of the Navy under the Defense Environmental Restoration Program (DERP) (10 U.S. Code §2701, et seq.), the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA), Executive Order 12580, and the National Oil and Hazardous Substances Pollution Contingency Plan (NCP) (Title 40 Code of Federal Regulations [CFR] Part 300).

NAS Fallon is planning and executing environmental restoration activities in response to releases of hazardous substances and contaminants. This SMP covers the status, management, response strategy, and action items related to these environmental restoration activities. The plan establishes an environmental investigation and restoration strategy and sets priorities for environmental investigation and restoration.

This SMP is a planning document specifically developed to provide the framework for implementing and scheduling environmental restoration at NAS Fallon. It is a dynamic document that will be updated periodically to reflect the status of environmental restoration and evolving strategies designed to address environmental concerns at NAS Fallon. This document describes the history of environmental investigations at NAS Fallon; discusses the environmental restoration strategy; sets priorities for environmental investigations and restoration; and provides near-term and out-year schedules. As mentioned, this SMP will be updated regularly to reflect new information that has been gathered and any changes to the schedule that have occurred.

The priorities identified in the schedules are based primarily on the risks to human health and the environment but also consider budgetary resources. Revisions to these schedules are anticipated in response to information developed during ongoing investigation and remediation projects; thus, the schedules will be revised as required. The updates will allow for flexibility in the environmental restoration process by providing the Navy and the State of Nevada with the ability to reallocate resources to high-priority tasks based on the most current information.

This SMP is organized into the following sections:

- Section 1.0 provides an introduction to this document and discusses its overall purpose.
- Section 2.0 provides general background information about NAS Fallon, including descriptions of the history and mission and a summary of environmental programs and participants.
- Section 3.0 presents a detailed fact sheet for each site that includes site description, major documents, and status. One or more maps of each site is also provided.
- Section 4.0 provides a list of the reference documents cited in this SMP.

Figures are included at the end of each section. In addition, appendices provided at the end of this SMP include Appendix A, Schedules, and Appendix B, Administrative Record Index.

## **2.0 GENERAL INFORMATION**

This section describes NAS Fallon and its history and mission and provides a summary of environmental programs.

### **2.1 DESCRIPTION OF NAS FALLON**

NAS Fallon is located 7 miles southeast of Fallon, Nevada, the county seat of Churchill County (Figure 2-1). Reno, Nevada, lies 60 miles west of Fallon. The main station comprises 8,583 acres and is located in the central part of the Carson Desert, commonly referred to as the Lahontan Valley. It includes airfield and maintenance facilities, public works and supply facilities, and housing. An additional 14 parcels (four of which are used as aerial weapons training ranges) are located in the general vicinity of the main station.

There is very little topographical relief at NAS Fallon except that formed by the built-up areas of runways, taxiways, and aircraft parking aprons. Surface water flows toward the Stillwater Lakes, a chain of small lakes, ponds, and marshes in the northern half of the Carson Desert. Groundwater beneath the facility generally flows toward Carson Lake, located about 3 miles south of the facility. Much of the area around the facility is irrigated, and there are several irrigation drains and canals to deliver surface water and two drains to remove excess surface water. The drains generally intersect the shallow aquifer and remove excess water from the farmland.

### **2.2 NAS FALLON HISTORY AND MISSION**

NAS Fallon was originally established as a military facility in 1942, when the Civil Aviation Administration and Army Air Corps constructed four airfields in Nevada as part of the Western Defense Program. In 1943, the Navy assumed control of the facility, and on June 10, 1944, Naval Air Auxiliary Station (NAAS) Fallon was commissioned. The facility provided training, servicing, and support to air groups sent to the facility for combat training. At war's end, Fallon was placed in caretaker status until it was designated as an auxiliary landing field for NAS Alameda in 1951.

NAAS Fallon was re-established on October 1, 1953. From 1958 to 1972, the station was designated Van Voorhis Airfield in honor of a Medal of Honor recipient from Fallon. The station was expanded and upgraded in the early 1960s to prepare aircrews for Vietnam duty. NAAS Fallon was upgraded to its current status as NAS Fallon on January 1, 1972.

NAS Fallon's mission is "To provide the most realistic integrated air warfare training support available to carrier air wings, Marine air groups, tenant commands, and individual units participating in training events including joint and multinational exercises." NAS Fallon is home to the Naval Strike and Air Warfare Center, the Strike Fighter Weapon Detachment, Fighter Squadron Composite 13 and Construction Battalion Unit 303.

As of 2010 the NAS Fallon base population is about 3,000 active duty and civilian Department of Defense (DoD) personnel.

## **2.3 SUMMARY OF ENVIRONMENTAL PROGRAMS**

Historical contaminant releases associated with operations at NAS Fallon include jet fuel (JP-4, JP-5 and JP-8), oil, aviation gasoline (AVGAS), gasoline, antifreeze, hydraulic fluid, solvents, paint, pesticides, and industrial and municipal garbage. Responses to these releases fall within the scope of the DERP, a program DoD developed to take appropriate response actions to investigate and, where necessary, address releases of hazardous substances or pollutants and contaminants, and correcting other environmental damage (DoD 2001). DERP was established by §211 of the Superfund Amendments and Reauthorization Act (SARA) of 1986.

### **2.3.1 Installation Restoration Program**

In accordance with DERP, DoD has established program categories based on the type of environmental restoration activity. DoD established the Installation Restoration Program (IRP) category to address releases of:

- Hazardous substances and contaminants
- Petroleum, oil, or lubricants
- Materials unique to DoD
- Low-level radioactive materials or low-level radioactive wastes
- Certain activities related to implementation of DoD's lead-based paint policy
- Explosive compounds released to soil, surface water, sediments, or groundwater as a result of ammunition or explosives production or manufacturing at ammunition plants
- Military munitions (unexploded ordnance or waste military munitions)

The purpose of the Navy's IRP is to reduce the risk to human health and the environment from past waste disposal operations and hazardous material spills at Navy facilities in a cost-effective manner consistent with DERP requirements. The focus is on moving an IRP site from identification and investigation to cleanup and closure. IRP activities are conducted in accordance with the guidelines, rules, and criteria set forth in CERCLA, the NCP, and other applicable environmental laws and their implementing regulations.

There are 33 IRP sites at Fallon. Seventeen of these sites have been closed as "No Further Action" (NFA) with Nevada Division of Environmental Protection (NDEP) concurrence. Remedies are being implemented at three landfill sites (IRP Sites 20, 21, and 22) in the form of re-grading the existing landfill cover, groundwater monitoring, and institutional controls selected in decision documents. Site 18, the Southeast Runway Landfill, is entering the decision phase with a focused feasibility study (FS) with decision documents to follow. The likely alternative will be source containment using a presumptive remedy for landfills with long-term monitoring.

A removal action was undertaken for soils at Site 4, the Transportation Yard, and the site is now closed. Contaminated groundwater at this site is being addressed as part of Site 2.

There are eight active IRP sites: Sites 1, 2/4, 3, 14, and 16, which are being addressed under CERCLA and underground storage tank-restoration (UST-R) or fuel sites: Site 6, UST-R Site 1 (Building 395 Area) and UST-R Site 2 (Building 806 Area), which are being addressed under the State of Nevada's corrective action program. Additional investigation is currently underway at all of these active sites. An remedial investigation (RI) addendum/FS report is being prepared for Sites 1, 14, and 16 (which were grouped into the Southern Operable Unit [OU]), and a second RI addendum\FS report is being prepared for Sites 2/4 and 3 (which were grouped into the Northern OU). Sites included in the Southern and Northern OUs were grouped together as a result of their respective proximity, hydrogeologic conditions, and similar nature of groundwater contaminants. A Contaminant Investigation Report for Fuel Sites is being completed for UST-R Site 1 (Building 395 Area), UST-R Site 2 (Building 806 Area), and Site 6. After these reports are completed, final remedies will be selected and decision documents will be prepared.

Three sites were recently added to the IRP: Site 28, the Northeast Runway Jet Fuel Spill which will be addressed under CERCLA and UST-R Site 4 (Building 201 Area) and UST-R Site 5 (Building 314 Area) which will be addressed under the State of Nevada's corrective action program. These sites will require further investigation to delineate the extent of the contamination. Results will be documented in future RI addendum/FS and contaminant investigation report for fuel sites.

### **2.3.1.1 CERCLA**

The goal of CERCLA is to reduce, in a cost-effective manner, the risk to human health and the environment from hazardous substance contamination resulting from past industrial operations. This objective is achieved by creating management strategies that proceed through a rigorous remedial action process; opportunities can be explored for accelerated cleanup during all phases of the process. CERCLA authorizes or directs the federal government to identify, investigate, and clean up or control releases of hazardous substances, contaminants, and pollutants. These cleanup activities are conducted under certain delegations of Presidential authority (for example, Executive Order 12580), so that DoD is the lead agency.

CERCLA has no cleanup standards of its own. Instead, it uses cleanup standards from other federal and state laws and regulations, through selection of applicable or relevant and appropriate requirements (ARARs). A law or regulation is "applicable" if the legal standard would apply independently of the CERCLA cleanup. A law or regulation is "relevant and appropriate" if it makes sense to apply it at the site even though it is not otherwise legally required. CERCLA requires compliance with federal laws and regulations and more stringent state laws and regulations that are identified as ARARs when response actions are conducted, unless these requirements are waived.

CERCLA requires the establishment of an administrative record, which forms the basis for selection of the response action for a site and consists of all documents that have a legal bearing and were used to select the response action. This record is the basis for any future legal review of decisions on the final remedial action taken at a site and is available for public review and

comment. The administrative record for NAS Fallon is maintained by the Naval Facilities Engineering Command Southwest (NAVFAC Southwest) (an index is provided in Appendix B); the availability and location of the documents incorporated in the record are coordinated through the NAS Fallon Public Affairs Office. Certain documents are available for review periodically during public comment periods for environmental activities such as RIs, FS, proposed plans, Records of Decision (ROD), removal actions, and significant remedial actions at hazardous waste sites.

DoD is required to respond to releases of CERCLA hazardous substances by following CERCLA requirements and guidance and policies developed by the U.S. Environmental Protection Agency (EPA) under its CERCLA authority. The definition of CERCLA hazardous substances excludes petroleum, including crude oil or any fraction thereof, natural gas, natural gas liquids, liquefied natural gas, or synthetic gas usable for fuel. Therefore, DoD cannot respond to petroleum-only releases under CERCLA.

Soil, groundwater, or both at some IRP sites may be contaminated by petroleum products; however, CERCLA contaminants are also present and may be commingled with the petroleum. Sites with petroleum contamination but no CERCLA contaminants are administered separately from CERCLA, as described in Section 2.3.1.2. Specific information and detailed maps for each of the IRP sites are provided in Section 3.

CERCLA provides for two types of actions when responding to a release of a CERCLA hazardous substance: removal actions and remedial actions. A removal action is a response implemented in an expedited manner; it may address a discrete portion of the release or site, or it may address long-term threats sufficiently to serve as the final remedy. A remedial action is a comprehensive action designed to finally and permanently address all unacceptable risk posed by the release of CERCLA hazardous substances.

In determining the appropriate extent of a response for a given release, either through a removal or a remedial action, the Navy reviews current site conditions and information produced by previous studies or investigations, including a preliminary assessment/site inspection (PA/SI) or a RI, while considering the following factors:

- Actual or potential exposures to nearby human populations, animals, or the food chain from released hazardous substances;
- Actual or potential contamination of drinking water supplies or sensitive ecosystems;
- Hazardous substances, pollutants, or contaminants in drums, barrels, tanks, or other bulk storage containers that may pose a threat of release;
- High levels of hazardous substances, pollutants, or contaminants in surface soil that may migrate;
- Weather conditions that may cause hazardous substances, pollutants, or contaminants to migrate or be released;
- Threat of fire or explosion; and
- Other situations that may pose threats to human health or the environment.

The Navy also considers the following criteria for determining if a removal action is appropriate:

- Whether the source of the contamination can be removed quickly and effectively;
- Whether the access to contamination can be limited (human exposure is substantially reduced); and
- Whether a removal action is the most expeditious manner of remediating the site.

The removal action should be compatible with future remedial actions and should strive to achieve ARAR. Compliance with ARARs depends on the urgency of the situation and the scope of the removal action to be conducted.

There are three categories of removal actions: (1) time critical removal actions (TCRA); (2) emergency removal actions, and (3) non-time critical removal actions (NTCRA). These categories are based on the type of situation, the urgency of the threat of the release, and the planning period that exists in which the action is initiated. TCRA's are those removal actions for which a planning period is six months or less before field work is initiated. Emergency removal actions are necessary when there is a release that requires on-site activities to begin within hours or days. NTCRA's are taken when a removal action is determined to be appropriate, but a planning period of at least six months is available before on-site activities must begin. Any response action cannot disrupt base operations unless there is an immediate threat.

In some cases, it is necessary to establish cleanup standards for the removal action. In other cases, such as where a removal action is implemented for source control or for limiting exposure, cleanup standards may not be established. In these cases, a permanent remedy may be required, so the removal action should be compatible with any remedial action that may be selected or be cost-effective enough to be considered a reasonable short-term expenditure.

The decision to complete a removal action is contained in an Action Memorandum (AM). For NTCRA's, the AM is supported by an engineering evaluation/cost analysis (EE/CA), a document that evaluates different removal alternatives.

### **Hydrologic Studies**

A basewide hydrologic monitoring program was implemented in 2008 to provide a comprehensive characterization of subsurface conditions and to monitor the physical and chemical interactions between groundwater and surface water. Groundwater quality samples from selected monitoring wells located at IRP sites and near surface water drains are collected and analyzed for total dissolved solids (TDS), volatile organic compounds (VOC), and polynuclear aromatic hydrocarbons (PAH) semiannually in March and October. In the spring, groundwater sampling occurs before the Truckee-Carson Irrigation District releases surface water from the Lahontan Reservoir to the local irrigation drains. As a result, samples collected in March reflect baseflow groundwater conditions before the surface water is released. Groundwater sampling in October occurs after the summer irrigation period and before flow stops to the irrigation drains for the winter. Conducting groundwater sampling during baseflow conditions (minimal influence of surface water) in the spring and at times of greatest potential for surface water recharge to the groundwater system in the fall helps to assess seasonal

variability and the relative effects of the groundwater system on surface water quality. In addition, groundwater level and temperature data from pressure transducers and groundwater flow direction and flow rate data from velocity sensors are obtained hourly and downloaded quarterly.

Surface water quality samples are collected and analyzed for TDS, VOCs, PAHs, and polychlorinated biphenyls from five locations annually in March. In addition, at one location surface in the Lower Diagonal drain, downgradient of the E4X drain, surface water samples are collected monthly and analyzed for five VOCs (vinyl chloride, cis-1,2- dichloroethene [DCE] and trans-1,2-DCE, trichloroethene [TCE], and tetrachloroethene [PCE]).

As part of the basewide program, a Well Utilization Plan was prepared (Tetra Tech 2010a). This plan evaluates the suitability of the wells at NAS Fallon for continued groundwater monitoring; establishes a monitoring well network based on construction and placement of monitoring wells at IRP sites, drains, and station boundaries; and identifies wells that are no longer useful to the NAS Fallon IRP and that should be abandoned. The plan was completed to ensure that wells included in the NAS Fallon network are maintained according to Nevada Administrative Code (NAC) 534 for future IRP activities.

The monitoring well network is dynamic. The Navy will modify the monitoring well network, as necessary, to ensure that the wells used for future IRP activities at NAS Fallon follow NAC 534 standards. The current basewide hydrologic monitoring program is intended to determine the stability of contaminants, monitor whether they are migrating off base, evaluate groundwater/surface water interactions, and to further develop and refine the basewide conceptual model. Basewide groundwater and surface water data are continually updated and incorporated into annual groundwater quality monitoring reports. Results are also presented at quarterly Remedial Project Manager meetings.

## **Risk Assessment**

Human health and ecological risk assessments were completed as part of the original RI (Oak Ridge National Laboratory [ORNL] 1994). Since the original RI was completed, additional soil, groundwater, and soil gas data have been collected to characterize current conditions. Soil and groundwater data were collected during 2007 and 2008, and soil gas data were collected in 2010. Human health risks will be evaluated for IRP Sites 1, 2, 3, 4, 6, 14, 16, 18, UST-R Site 1 (Building 395 Area), and UST-R Site 2 (Building 806 Area) and ecological risks will be evaluated for sites with viable habitat for ecological receptors including Sites 1, 6, 16, and the area west of Site 2 using current data and risk assessment methodologies, as described below. The updated risks will be presented in RI addendum/FS and contaminant investigation reports. The results of the risk assessments will be used to provide a recommendation for site closure with no further action, or progression to an evaluation of remedial alternatives.

### **Human Health**

A baseline human health risk assessment (HHRA) will be completed for each site to estimate cancer risks and noncancer health effects associated with potential human exposure to chemicals in soil and groundwater under current and potential future land

uses. The methodology for the HHRA will follow EPA risk assessment guidance for CERCLA sites. Risks will be evaluated for a current industrial worker, future industrial worker, future construction worker, and future resident. Risks from exposure to soil will be assessed for each site individually. Soil exposure pathways that will be evaluated include incidental ingestion, dermal contact, and inhalation of chemicals that may be transported from soil to air. Groundwater exposure scenario for Sites 2/4 and 3 will be evaluated as a group (Northern OU and Sites 1, 14, and 16 will be evaluated as a separate group (Southern OU). Groundwater risks for the remaining petroleum sites, UST-R Site 1 (Building 395 Area), UST-R Site 2 (Building 806 Area), and Site 6 will be assessed on a site-specific basis. Groundwater exposure pathways will include ingestion, dermal contact, and inhalation during domestic use. Potential health risks from inhalation of volatile chemicals in soil and groundwater that may migrate to indoor air from subsurface vapor intrusion will also be calculated using soil gas data and vapor intrusion modeling.

## **Ecological**

A screening level ecological risk assessment (SLERA) will be conducted for sites with viable habitat to evaluate whether risks are associated with the exposure to specific chemicals of concern at a given site. Risks will be estimated by comparing chemical concentrations in soil directly with media-based threshold values for plants and invertebrates, or by modeling chemical doses to avian and mammalian representative receptors using a food chain model and comparing the dose estimates with threshold dose values. Representative upper-trophic level bird and mammal species that will be evaluated in the SLERA include the mourning dove (*Zenaida macroura*), western meadowlark (*Sturnella neglecta*), red-tailed hawk (*Buteo jamaicensis*), Merriam's kangaroo rat (*Dipodomys merriami*), deer mouse (*Peromyscus maniculatus*), and coyote (*Canis latrans*). Risks to burrowing mammals (Merriam's kangaroo rat and the deer mouse) will also be evaluated for potential inhalation exposure to vapors in burrows from subsurface soil and groundwater. A qualitative evaluation of the risks to reptiles will also be conducted. The methodology for the SLERA will follow Navy and EPA risk assessment guidance for CERCLA sites. Habitat viability was determined at each site in February 2007 by an ecological risk assessor. A SLERA is not needed for sites for which no viable habitat exists.

Chemicals identified in the SLERA as posing potential risks at a given site will proceed to the first step of a baseline ecological risk assessment (BERA). This refinement step is referred to as Step 3a and is more site-specific and technically rigorous, and less conservative when compared to the SLERA. Step 3a involves refining the conservative exposure assumptions employed in the SLERA and recalculating the risk estimates using statistically-based exposure point concentrations rather than maximum concentrations.

## **Basewide Reports**

Key documents that address potential environmental concerns at NAS Fallon include the initial RI report (ORNL 1994), the public health assessment (Agency for Toxic Substances and Disease

Registry [ATSDR] 2003), and the *Data Summary and Recommendations Report Related to Focused Feasibility Study for Installation Restoration Sites* (Battelle 2003a).

The initial RI report addressed the 21 sites recommended for further investigation in the PA/SI (Dames and Moore 1988). The public health assessment was prepared to evaluate exposure pathways and to respond to community concerns about past, current, and potential future exposures to contaminants originating at NAS Fallon. The data summary and recommendations report summarized the existing contamination characterization data for the following active IRP sites at NAS Fallon (Sites 1, 2/4, 3, 6, 14, and 16).

In 2006, the Navy updated the initial RI for Sites 1, 2/4, 3, 6, 14, and 16 (which were summarized in the 1994 RI), plus two additional UST-R sites (UST-R Sites 1 and 2). Several field activities were conducted in 2007 to strategize future RI addenda sampling. These activities included passive soil gas sampling at Sites 6 and 16 and data collection using the site characterization and analysis penetrometer system (SCAPS). The SCAPS investigation was conducted using laser-induced fluorescence to delineate areas of floating fuel (free) product and contamination in the soil smear zone at Sites 1, 2/4, 14, 16, UST-R Site 1 (Building 395 Area) and UST-R Site 2 (Building 806 Area). The data improved characterization of free product, identified additional sources of free product, defined the horizontal and vertical extent of free product at each site, and identified data gaps to be addressed during RI addendum/FS and Contaminant Investigation Report Fuel Sites field activities.

In 2007 and 2008, additional data for surface and subsurface soil and groundwater were collected from Sites 1, 2/4, 3, 6, 14, and 16 and UST-R Sites 1 and 2 to update the 1994 RI and provide data for the Contaminant Investigation Report for Fuel Sites. Preliminary evaluation of soil and groundwater data indicated several areas where volatile chemicals are present in the vicinity of occupied buildings. At that time, the Navy determined that soil gas data were necessary to evaluate inhalation of vapors to indoor air from subsurface vapor intrusion at these building locations.

Soil gas data were obtained from Sites 2/4, 3, 14, 16 and UST-R Site 2 (Building 806 Area) in 2010, and are currently being incorporated into the HHRA to evaluate the vapor intrusion pathway to indoor air. Soil, groundwater, and soil gas results will be used to evaluate risks to human health. All results will be included in updated RI addenda and Fuel Sites reports that are currently being prepared.

Three additional sites, Site 28, UST-R Site 4, and UST-R Site 5 will be included in the IRP. The sites will require further investigation to delineate the extent of the contamination. Results will be documented in future RI addendum/FS and Contaminant Investigation for Fuel Sites. Additional site-specific information regarding each of sites is included in Section 3.

### **Basewide Installation Restoration Program Database**

The Navy is committed to maintaining a fully functional database management system (DBMS) that integrates IRP site data in support of environmental responses at NAS Fallon. The work on this task includes customizing, populating, and linking the IRP attribute data to the spatial data (associating sampling results with their locations); processing chemical data; and coordinating

data transfer among IRP contractors. The DBMS will be used as an environmental decision-making tool. This work also involves establishing data transfer protocols that facilitate efficient data transfer between contractors and the Navy. The Navy has established the Naval Installation Restoration Information Solution (NIRIS) to organize and share environmental data between Navy personnel and contractors using a web-based geographic information system. The database will allow spatial analysis to assist in interpreting soil and groundwater data.

### **2.3.1.2 Petroleum Sites**

The State of Nevada manages and enforces its state petroleum program. A release solely of petroleum should be assessed, evaluated, and addressed according to the Nevada UST program and the requirements of the corrective action program. An UST is defined to include all tanks and appurtenant piping that contain regulated substances when the overall volume is 10 percent or more beneath the ground surface. Petroleum releases from mechanisms other than USTs also fall under Nevada's corrective action requirements.

The Nevada UST regulations are promulgated at Nevada Administrative Code (NAC) §§ 459.9921 through 459.9995. These regulations require compliance with the corrective action regulations promulgated at NAC §§ 445A.226 to 445A.22755 for releases from USTs. The corrective action regulations require cleanup of releases of contaminants that exceed action levels in soil and groundwater. Corrective action must be taken when action levels for soil are exceeded unless a site owner or operator completes an evaluation of the site indicating that the contamination does not cause any current or potential threat to human health or the environment and considers factors listed in NAC § 445A.227(2)(a) through (k). Action levels for soil are promulgated at NAC § 445A.2272 and include: (1) the background concentration of a hazardous substance, hazardous waste or regulated substance set forth in a permit or study approved by the Division; or (2) a concentration of a hazardous substance, hazardous waste, or regulated substance that is protective of waters of the State, public health and safety for all identified routes of exposure, and the environment.

Corrective action must be taken when the action levels for groundwater are exceeded, unless the owner or operator submits a written request to the Director of the State Department of Conservation and Natural Resources (Director). The Director may grant the request if the following are satisfied:

- Each source of contamination is identified and controlled or no source remains because of the age and nature of the release
- The magnitude and extent of the contamination of the groundwater is known
- Data are available from at least 3 years of quarterly monitoring or another period specified by the Division and the data do not show a trend of increasing concentrations of the contamination

- A demonstration is made which indicates that natural attenuation is sufficient to reduce contamination below action levels or prevent migration to a receptor or another point of demonstration
- The groundwater is not a source of drinking water and is not likely to be a source in the future because (1) it is economically or technologically impractical to recover the water for drinking because of depth or location or render the water fit for human consumption, or (2) a legal restriction or institutional control is in place concerning the use of the groundwater

The Director may also not require corrective action if the owner or operator files a study, acceptable to the Division, that demonstrates that it is not feasible to achieve the required remediation standard based on prohibitive cost.

Action levels for groundwater are promulgated at NAC § 445A.22735 and include: (1) the presence of ½ inch or more of free product; (2) concentrations equal to maximum contaminant levels (MCL) established under the Safe Drinking Water Act; (3) the background concentration if the background concentration is greater than the MCL; or (4) if an MCL has not been established, a concentration equal to background or an appropriate level determined by the Division using Integrated Risk Information System (IRIS) values or an equivalent method.

### **2.3.1.3 Other Environmental Programs and Planning Documents**

In addition to CERCLA and the Nevada UST and corrective action programs, other environmental programs operating at NAS Fallon include:

- Resource Conservation and Recovery Act (RCRA). Navy facilities may be subject to RCRA if they generate, store, treat, or have disposed of hazardous waste. NAS Fallon does not hold any RCRA permits; however, the installation is classified as a large quantity generator. It has obtained a hazardous waste generator EPA identification number and is subject to a 90-day holding time for waste disposal.
- Range Management Program, which defines sustainable range management as management of an operational range in a manner that (1) supports the national security objectives and maintains the operational readiness of the Armed Forces, and (2) ensures the long-term viability of operational ranges while protecting human health and the environment.
- Formerly Used Defense Sites Program (FUDS), which assigns responsibility to DoD for cleaning up properties that were formerly owned, leased, possessed, or operated by DoD. NAS Fallon FUDS include Aerial Gunnery Range East and West and Bombing Target A.

Environmental planning documents relevant to NAS Fallon include:

- Integrated Natural Resources Management Plan (INRMP), which allows NAS Fallon to implement landscape-level management of its natural resources while coordinating with various stakeholders.
- Integrated Cultural Resources Management Plan, which is similar to the INRMP except that it addresses cultural resources.
- NAS Fallon Overview Plan, which is a comprehensive land use and facilities plan intended to ensure logical and efficient use of facilities and real estate assets and to guide the installation's growth and change.

### **2.3.2 Participants**

Several elements of the Navy, state, and local regulatory agencies and members of the local community participate in the environmental activities at NAS Fallon. The following paragraphs describe the roles and responsibilities of key participants.

#### **NAS Fallon Environmental Division**

The NAS Fallon Environmental Division is responsible for all environmental activities for properties at the facility. Specific responsibilities include ensuring that environmental considerations are factored into land use decisions, implementing a community relations program for environmental work, and identifying funding needs.

**Point of Contact:** Installation Environmental Program Director/Public Works Officer  
Naval Air Station Fallon  
Bldg 307  
4755 Pasture Road  
Fallon, NV 89496

**Point of Contact:** Installation Environmental Program Manager  
Naval Air Station Fallon  
Bldg 307  
4755 Pasture Road  
Fallon, NV 89496

#### **Naval Facilities Engineering Command, Southwest**

Naval Facilities Engineering Command Southwest (NAVFAC Southwest), located in San Diego, California, is responsible for providing environmental engineering, technical, legal, and

contracting assistance to the NAS Fallon Environmental Division. This support includes identifying the resources needed to effectively implement the remedial action process and the IRP. NAVFAC Southwest is responsible for coordinating the work of Navy technical support agencies and contractors to accomplish IRP goals and policies. Other responsibilities include overall management of all phases of the projects, including problem definition through project design, remedial action, and closeout. NAVFAC Southwest will host meetings of the remedial project managers to discuss progress made and future work to be performed, as well as to resolve issues. These meetings will take place at a minimum of once per quarter; however, the frequency of the meetings can be increased if project needs change.

NAVFAC Southwest is also the primary point of contact for coordination between the Navy and representatives of the State of Nevada. The framework for coordination between the Navy and the state is developed in the DoD and State Memorandum of Agreement (DSMOA). The DSMOA is an overarching agreement between the DoD and the State of Nevada that provides a framework for working together through the Defense Environmental Restoration Program.

**Point of Contact:** R. Michael Quesada - (619) 532-4176  
Remedial Project Manager  
Code JE30.MQ  
1220 Pacific Hwy.  
San Diego, CA 92132-5190

### **Nevada Division of Environmental Protection**

NDEP is responsible for overseeing the cleanup of hazardous waste sites and for monitoring and regulating hazardous waste transportation, treatment, storage, and disposal for the State of Nevada. NDEP fulfills this responsibility by implementing and enforcing the provisions of the environmental laws and regulations contained in the Nevada Revised Statutes and the Nevada Administrative Code. NAS Fallon partners with NDEP to create a collaborative working environment, providing a platform for open communication, trust, and teamwork. Within this framework, NAS Fallon coordinates at all stakeholder activities, including any associated with the restoration advisory board (RAB) (NAS Fallon 2006). Additional information is provided on-line at <http://ndep.nv.gov>.

**Point of Contact:** Fallon Remedial Project Manager  
Nevada Division of Environmental Protection  
Department of Defense Branch  
Bureau of Corrective Actions  
901 S. Stewart Street, Suite 4001  
Carson City, NV 89701

### **NAS Fallon Restoration Advisory Board**

The NAS Fallon RAB is an advisory group consisting of members from NAS Fallon, the local community, and regulatory and cooperating agencies. The RAB advises the Navy on a variety of IRP topics, such as the scope of studies and cleanup methods, proposed project requirements,

and prioritization of remediation activities, and reviews plans and reports. The RAB at NAS Fallon is currently composed of representatives of NAS Fallon, NDEP, NAVFAC Southwest, U.S. Bureau of Reclamation, U.S. Fish and Wildlife Service, Churchill County Economic Department Authority, Churchill County Administration, City of Fallon, Nevada Department of Wildlife, Stillwater Wildlife Refuge, Truckee-Carson Irrigation District, Fallon Paiute-Shoshone Tribe, the Inter-Tribal Council of Nevada, and the community at large (NAS Fallon 2010). Meeting minutes and administrative coordination are provided by the NAS Fallon Public Affairs Office. The RAB provides the Navy with advice and information on community concerns so that informed decisions can be made about remediation. The RAB meets annually with the Navy and regulatory agencies.

**Point of Contact:** Public Affairs Officer (Code NOOPA1F)  
Naval Air Station Fallon  
4755 Pasture Road  
Fallon, NV 89496

### **Other Federal Agencies**

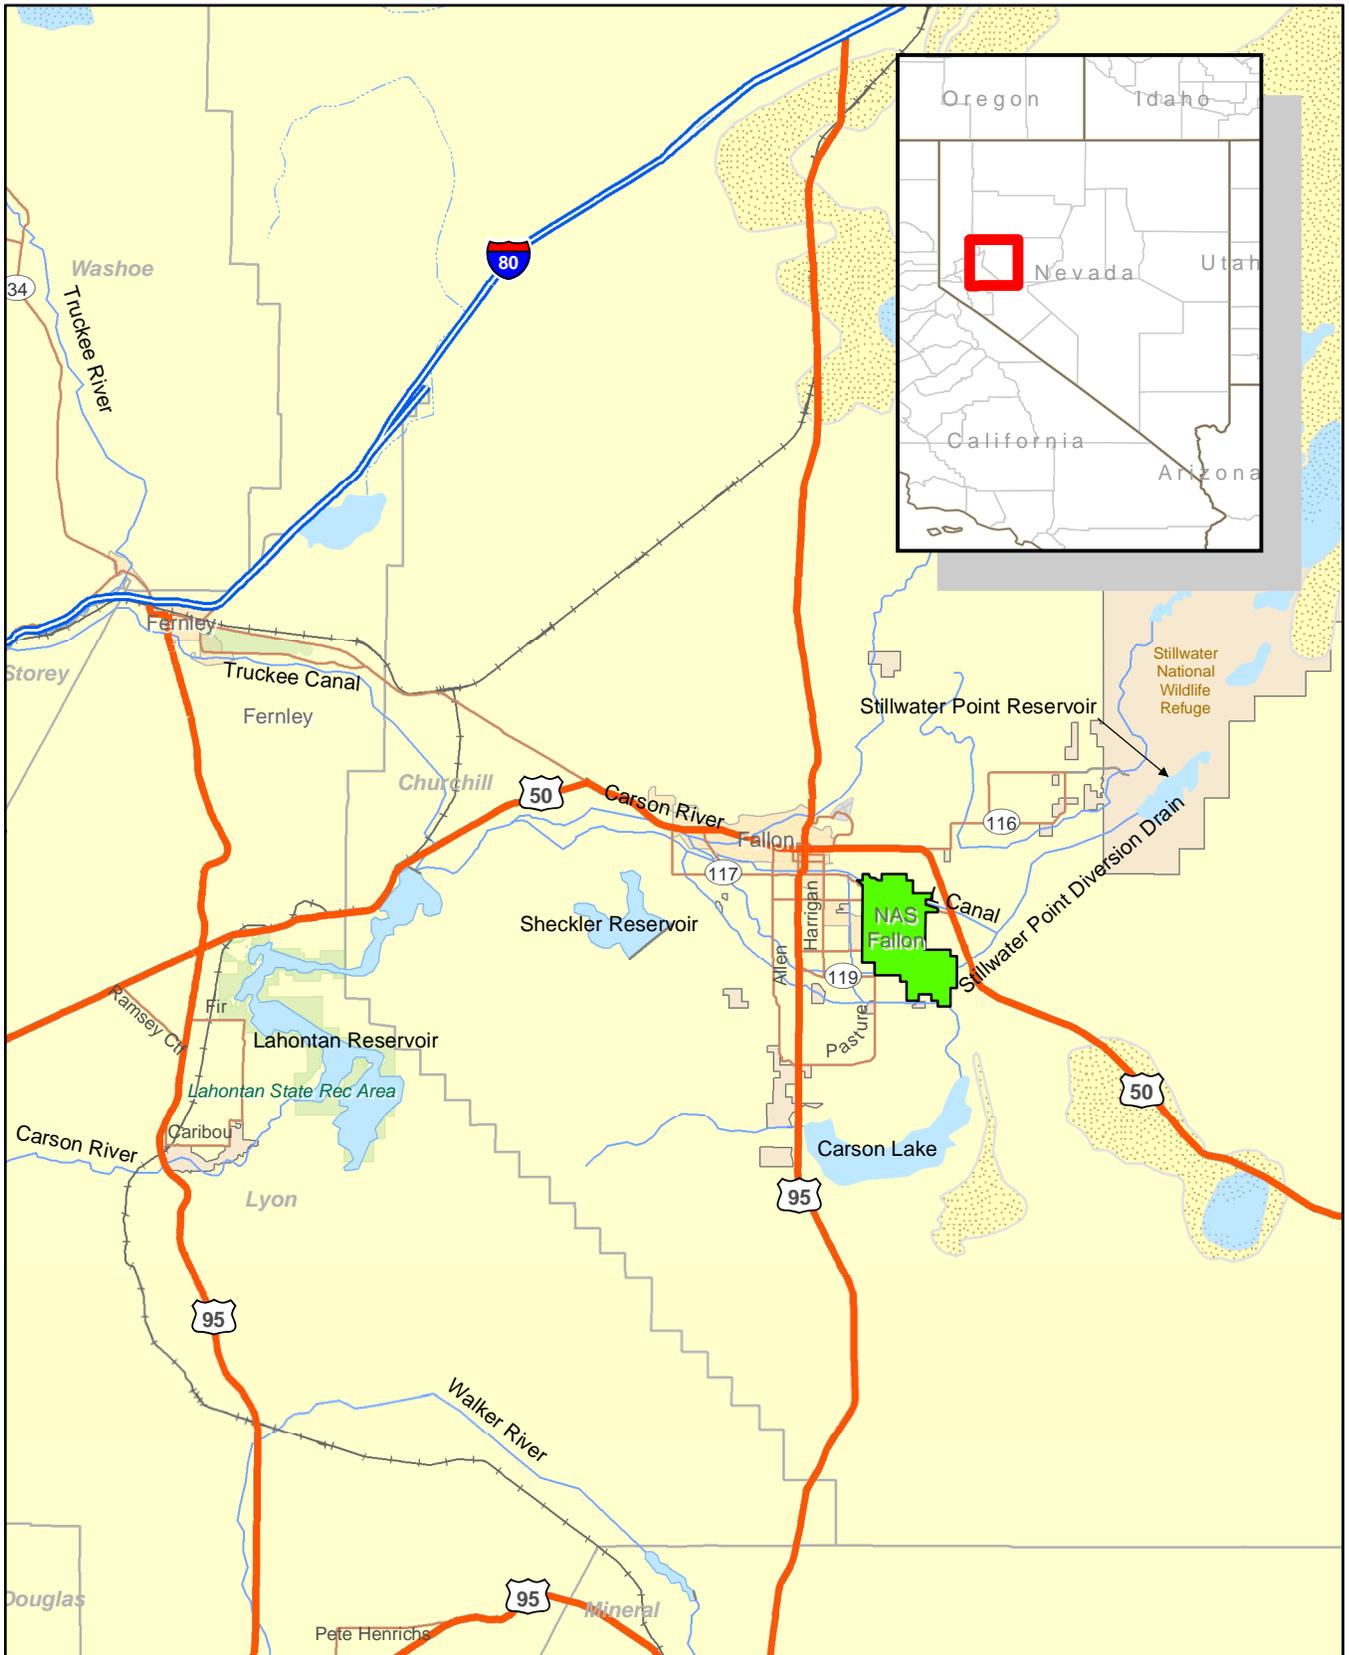

Other federal agencies are tangentially involved in the environmental cleanup at NAS Fallon. Major agencies and their involvement are discussed below.

The EPA is the primary federal agency responsible for protection of human health and the environment. EPA is responsible for development of guidance on hazardous waste site operations and cleanup. EPA also delivers technical and environmental training programs related to hazardous materials. Although direct involvement of the EPA at NAS Fallon historically and currently is limited future involvement is possible.

The Naval Facilities Engineering Service Center located at Port Hueneme, California, provides technical support to NAS Fallon and NAVFAC Southwest. This support includes technical studies, specialized field teams (including technology transfer teams), and field support guidance (such as manuals, guides, and standard procedures) to assist NAS Fallon in complying with the requirements of IRP.

The Bureau of Land Management (BLM) is the federal agency involved with NAS Fallon lands that are withdrawn from public use. BLM is a member of the NAS Fallon RAB.

The U.S. Bureau of Reclamation Lahontan Basin Area Office provides management and oversight for reclamation and interests in the three river basins that make up the Lahontan Basin Area. The area managed includes the Carson, Truckee, and Humboldt River basins. In addition, the Water Conservation Field Services Program is designed to: encourage water conservation; assist water agencies to develop and implement effective water management and conservation plans; coordinate with state and other local conservation plan efforts; and generally foster improved water management on a regional, statewide, and watershed basis. The NAS Fallon Environmental Department coordinates with the U.S. Bureau of Reclamation on surface drainages.

### **3.0 DESCRIPTIONS OF SITES**

The following pages present summaries for all 32 IRP sites identified at NAS Fallon. The status of the IRP sites is summarized in Section 2.3.1. Figure 3-1 shows the locations of the IRP sites, and Figure 3-2 presents a strategy flowchart for each site. The flowcharts include past actions, current activities, and proposed strategies to reach site closure.

Each site summary includes the location and a detailed site map. The regulatory authority is listed for each active site. The site summaries will be updated periodically. If additional sites are identified, they will be added as required.

**SITE NUMBER:** 1

**SITE NAME:** Crash Crew Training Area

**REGULATORY PROGRAM:** CERCLA

**RELATED SITES:** 14 and 16 (Southern OU includes Sites 1, 14, and 16)

### DESCRIPTION:

The Crash Crew Training Area is located in the southern portion of NAS Fallon. The site consisted of a former unlined earth-bermed pit 25 feet in diameter and about 3 feet deep and two aboveground storage tanks with capacities of 1,000 and 5,000 gallons. The tanks were linked by a pipeline system for underground distribution between the tanks and pit. The site was used from the mid-1950s until 1988 for fire training.

Flammable waste fuels and solvents were stored in the tanks before they were poured in the pit and ignited to conduct the training. An estimated 1.1 million gallons of flammable liquids were burned in the pit. Off-specification fuel (90 percent of wastes burned) was obtained from the old (Site 16) and new (Site 2) fuel farms and from the aircraft and vehicle maintenance shops. Napalm, off-specification fuel, oil, and solvents were burned from the mid-1950s to 1982, but only off-specification JP-5 jet fuel from the new fuel farm was burned from 1982 to April 1988. Solvents detected in groundwater at the site include PCE, TCE, vinyl chloride, 1,1-DCE, and cis-1,2-DCE.

### STATUS:

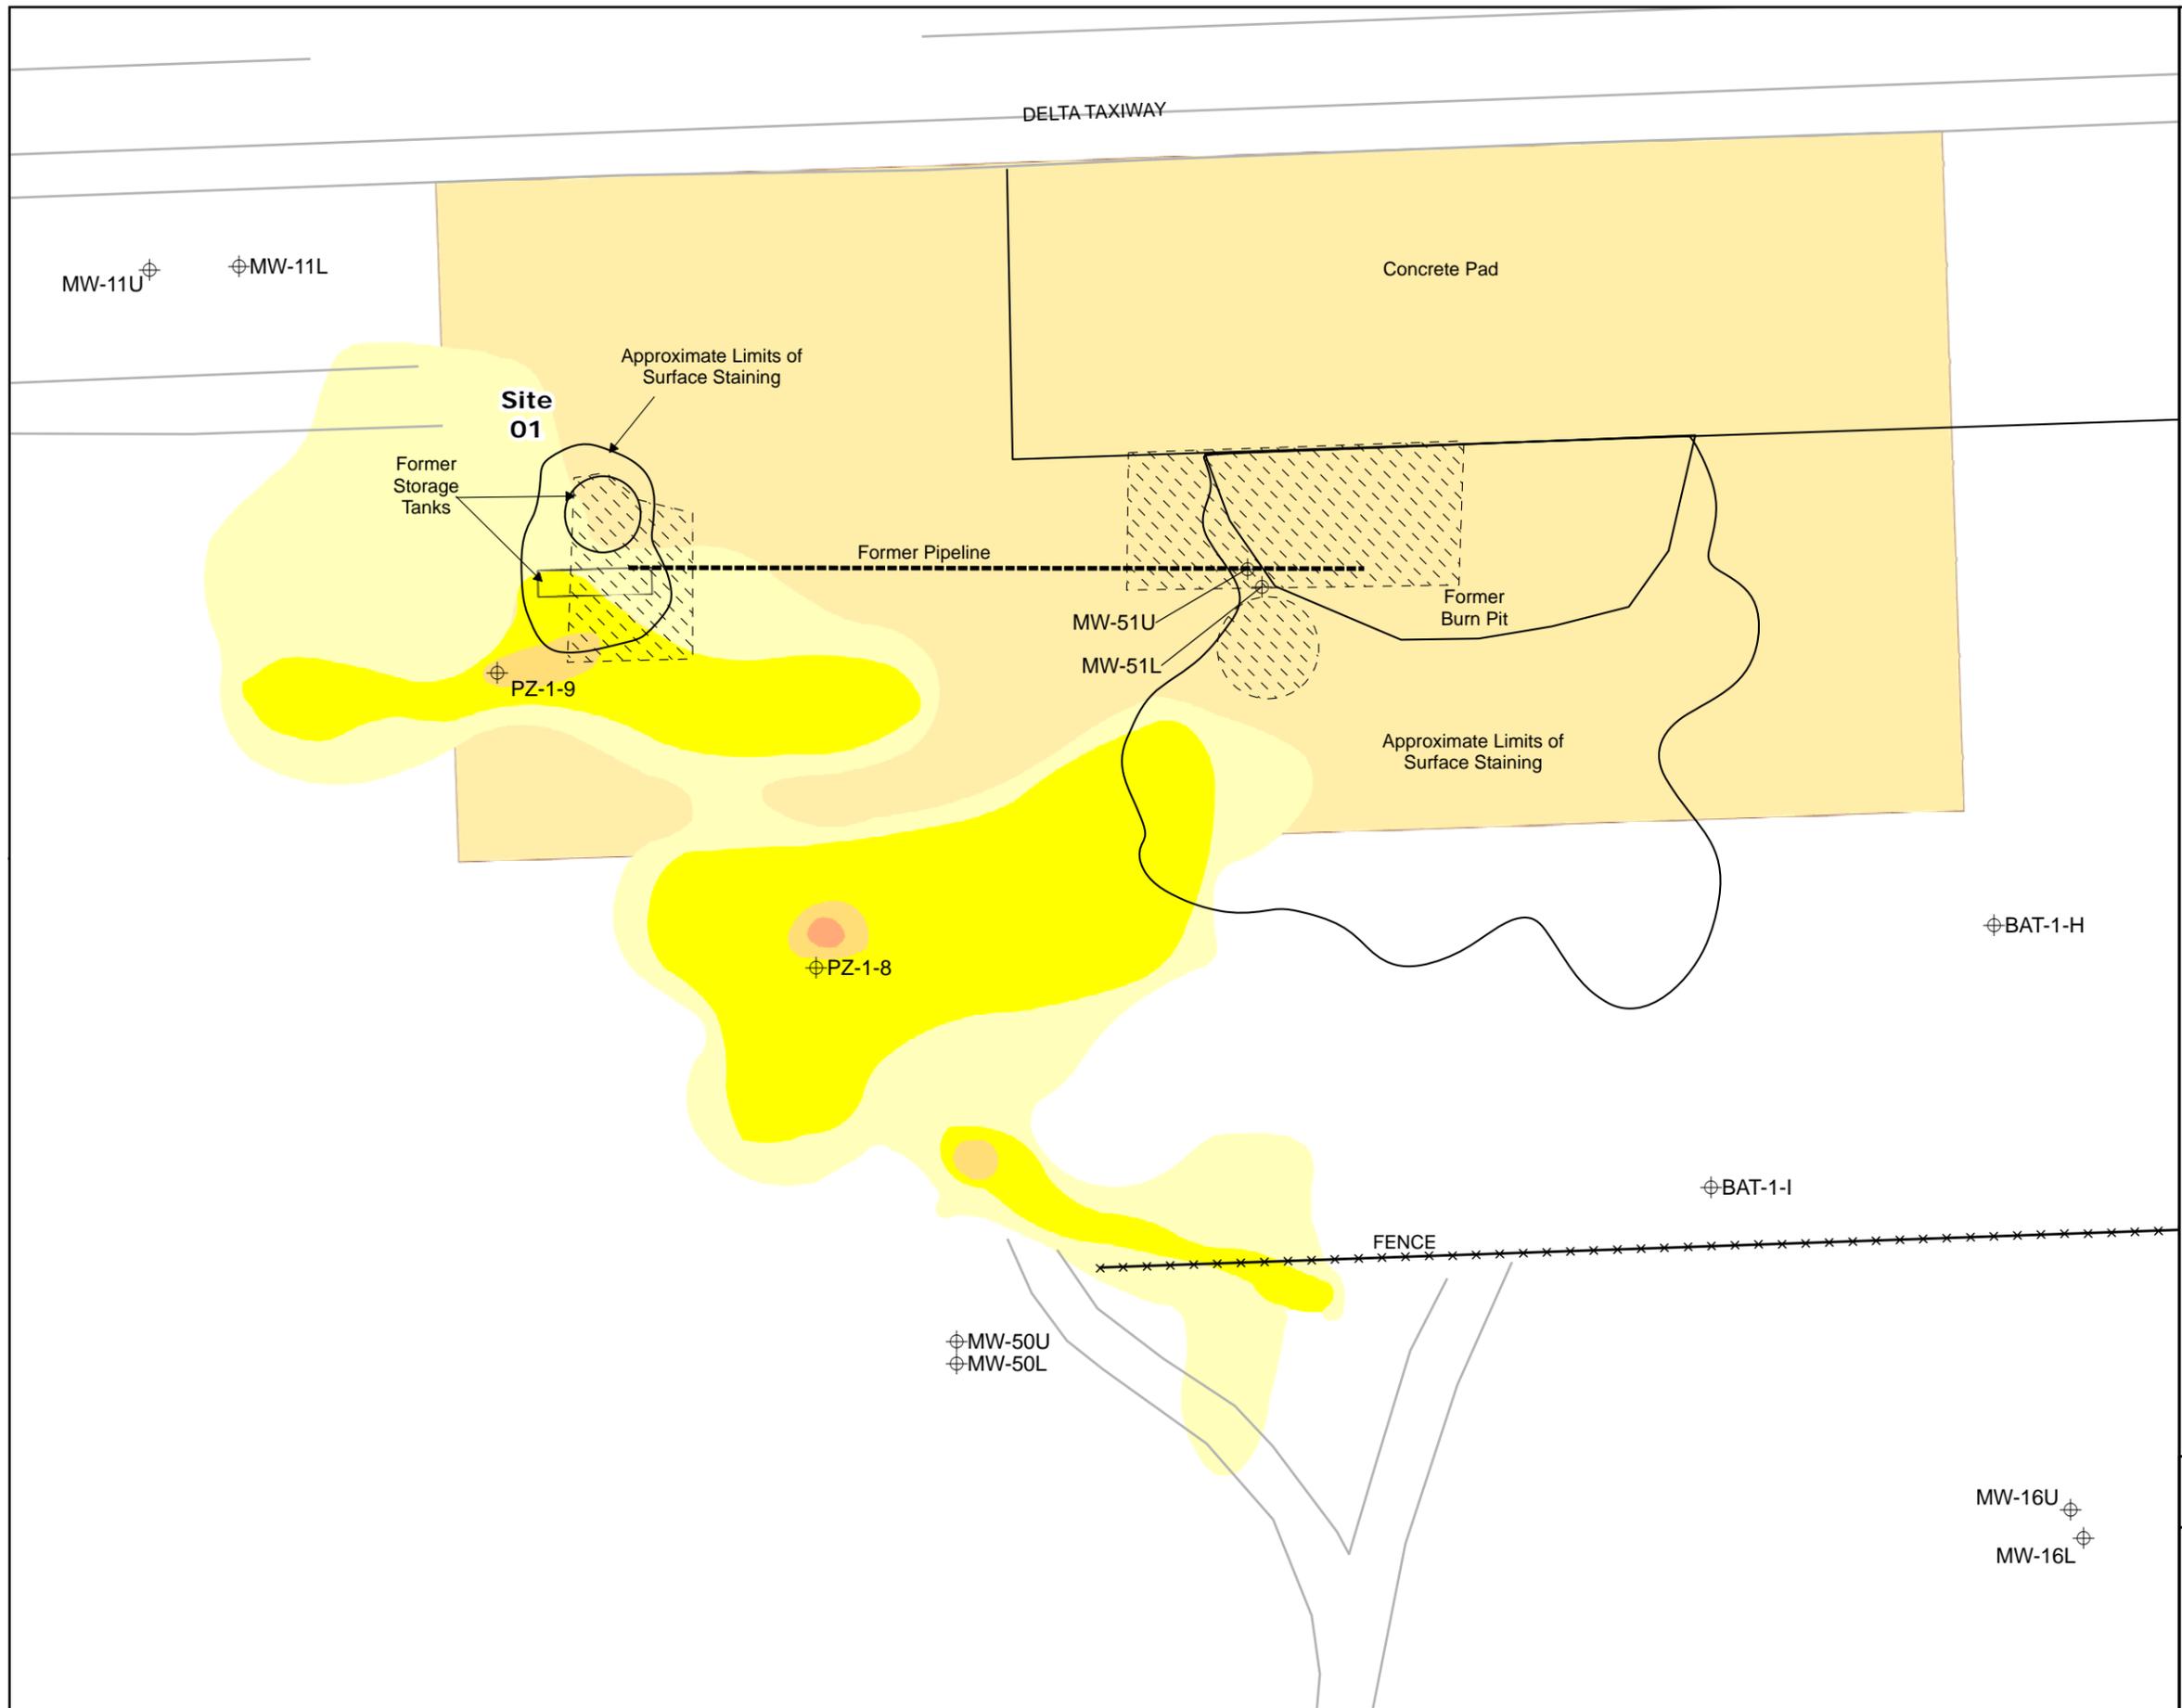

Approximately 900 gallons of free product were removed from Site 1 using a bioslurper system in 1996. The primary soil remediation effort at Site 1 involved using a “biopile” to reduce levels of total petroleum hydrocarbons (TPH) and VOC through a process of biodegradation remediation. The biopile was cultivated from 1999 through 2002. In July 2002, the Navy installed a fence and removed, treated, and disposed of the

contaminated “biopile” soil at an off-site disposal facility.

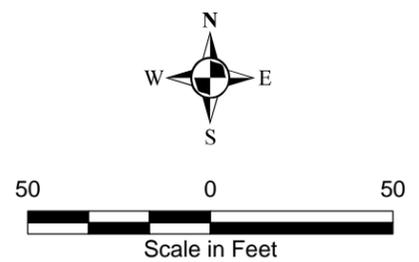

Pilot studies were conducted at Site 1 between August 26, 2002 and May 15, 2003 to evaluate selected technologies for treating chloroethenes contamination in groundwater. The pilot studies concluded that in situ air sparging and soil vapor extraction (AS/SVE) was an effective technology for reducing the concentration of dissolved chloroethenes in groundwater. Air stripping was found to be an effective technology for treating extracted groundwater. Enhanced anaerobic bioremediation via electron donor and the use of

an anaerobic bioreactor were not found to be effective technologies for the treatment of chloroethene contaminated groundwater at Site 1. The effectiveness of the selected technologies of these pilot studies are detailed in the Final Groundwater Pilot Studies (Battle 2004b).

In 2007, a SCAPS investigation delineated the extent of free product and smear zone. The SCAPS data and historical data were used to design an RI addendum/FS that is currently underway. Soil and groundwater data are being collected to update the risk assessment and identify a strategy for cleanup and site closure.

**SITE NUMBER:** 2

**SITE NAME:** NAS Fallon New Fuel Farm

**REGULATORY PROGRAM:** CERCLA

**RELATED SITES:** 3, 4 and UST-R Site 1 (Building 395 Area) (Northern OU includes Sites 2/4 and 3)

**DESCRIPTION:**

The New Fuel Farm is located in the northwestern part of NAS Fallon. It is used to store an estimated 3.3 million gallons of jet fuel (JP-8), 8,000 gallons of diesel fuel, and 12,000 gallons of motor vehicle gasoline fuel. The site has served as the main fuel storage and distribution terminal for NAS Fallon since 1957. The JP-8 fuel is received from an underground pipeline originating in Sparks, Nevada, and is currently stored in three aboveground storage tanks. Trucks that provide fuel to aircraft are fueled at the site.

Site 2 includes the former locations of five USTs, a tank bottom disposal area, an oil/water separator (OWS) leach field, a vehicle parking area, and a weed control area.

In 1992, two 50,000 aviation gasoline USTs were removed. In 2002, three USTs with a total capacity of 1.39 million gallons of fuel were removed. These three tanks held JP-5 and JP-8.

As much as 60,000 gallons of petroleum tank bottom waste (liquids containing approximately 90 percent water and 10 percent fuel) were disposed of from 1957 to 1981. Free product releases from the disposal of this tank bottom waste have commingled with releases from other sites in the Northern OU. Because the free product is associated with the disposal of petroleum tank bottom waste, the Navy will address these releases in compliance with the requirements of CERCLA and the NCP.

The tank bottom disposal area may have received an additional 5,000 gallons of JP-4 or JP-5 jet fuel

from a fuel tank that was leaking during the early 1960s. The oil/water separator, installed in 1981, collected surface runoff and spills from the tank and loading rack area. In 1985, about 2,000 gallons of JP-5 fuel spilled in this area and, between 1957 and 1981, as much as 18,000 gallons of fuel were spilled from daily draining of fuel trucks. It is estimated that 2,500 gallons of fuels have spilled in the vehicle parking area. About 500 gallons of waste fuel were applied to unpaved ground in the weed control area between 1957 and 1981.

**STATUS:**

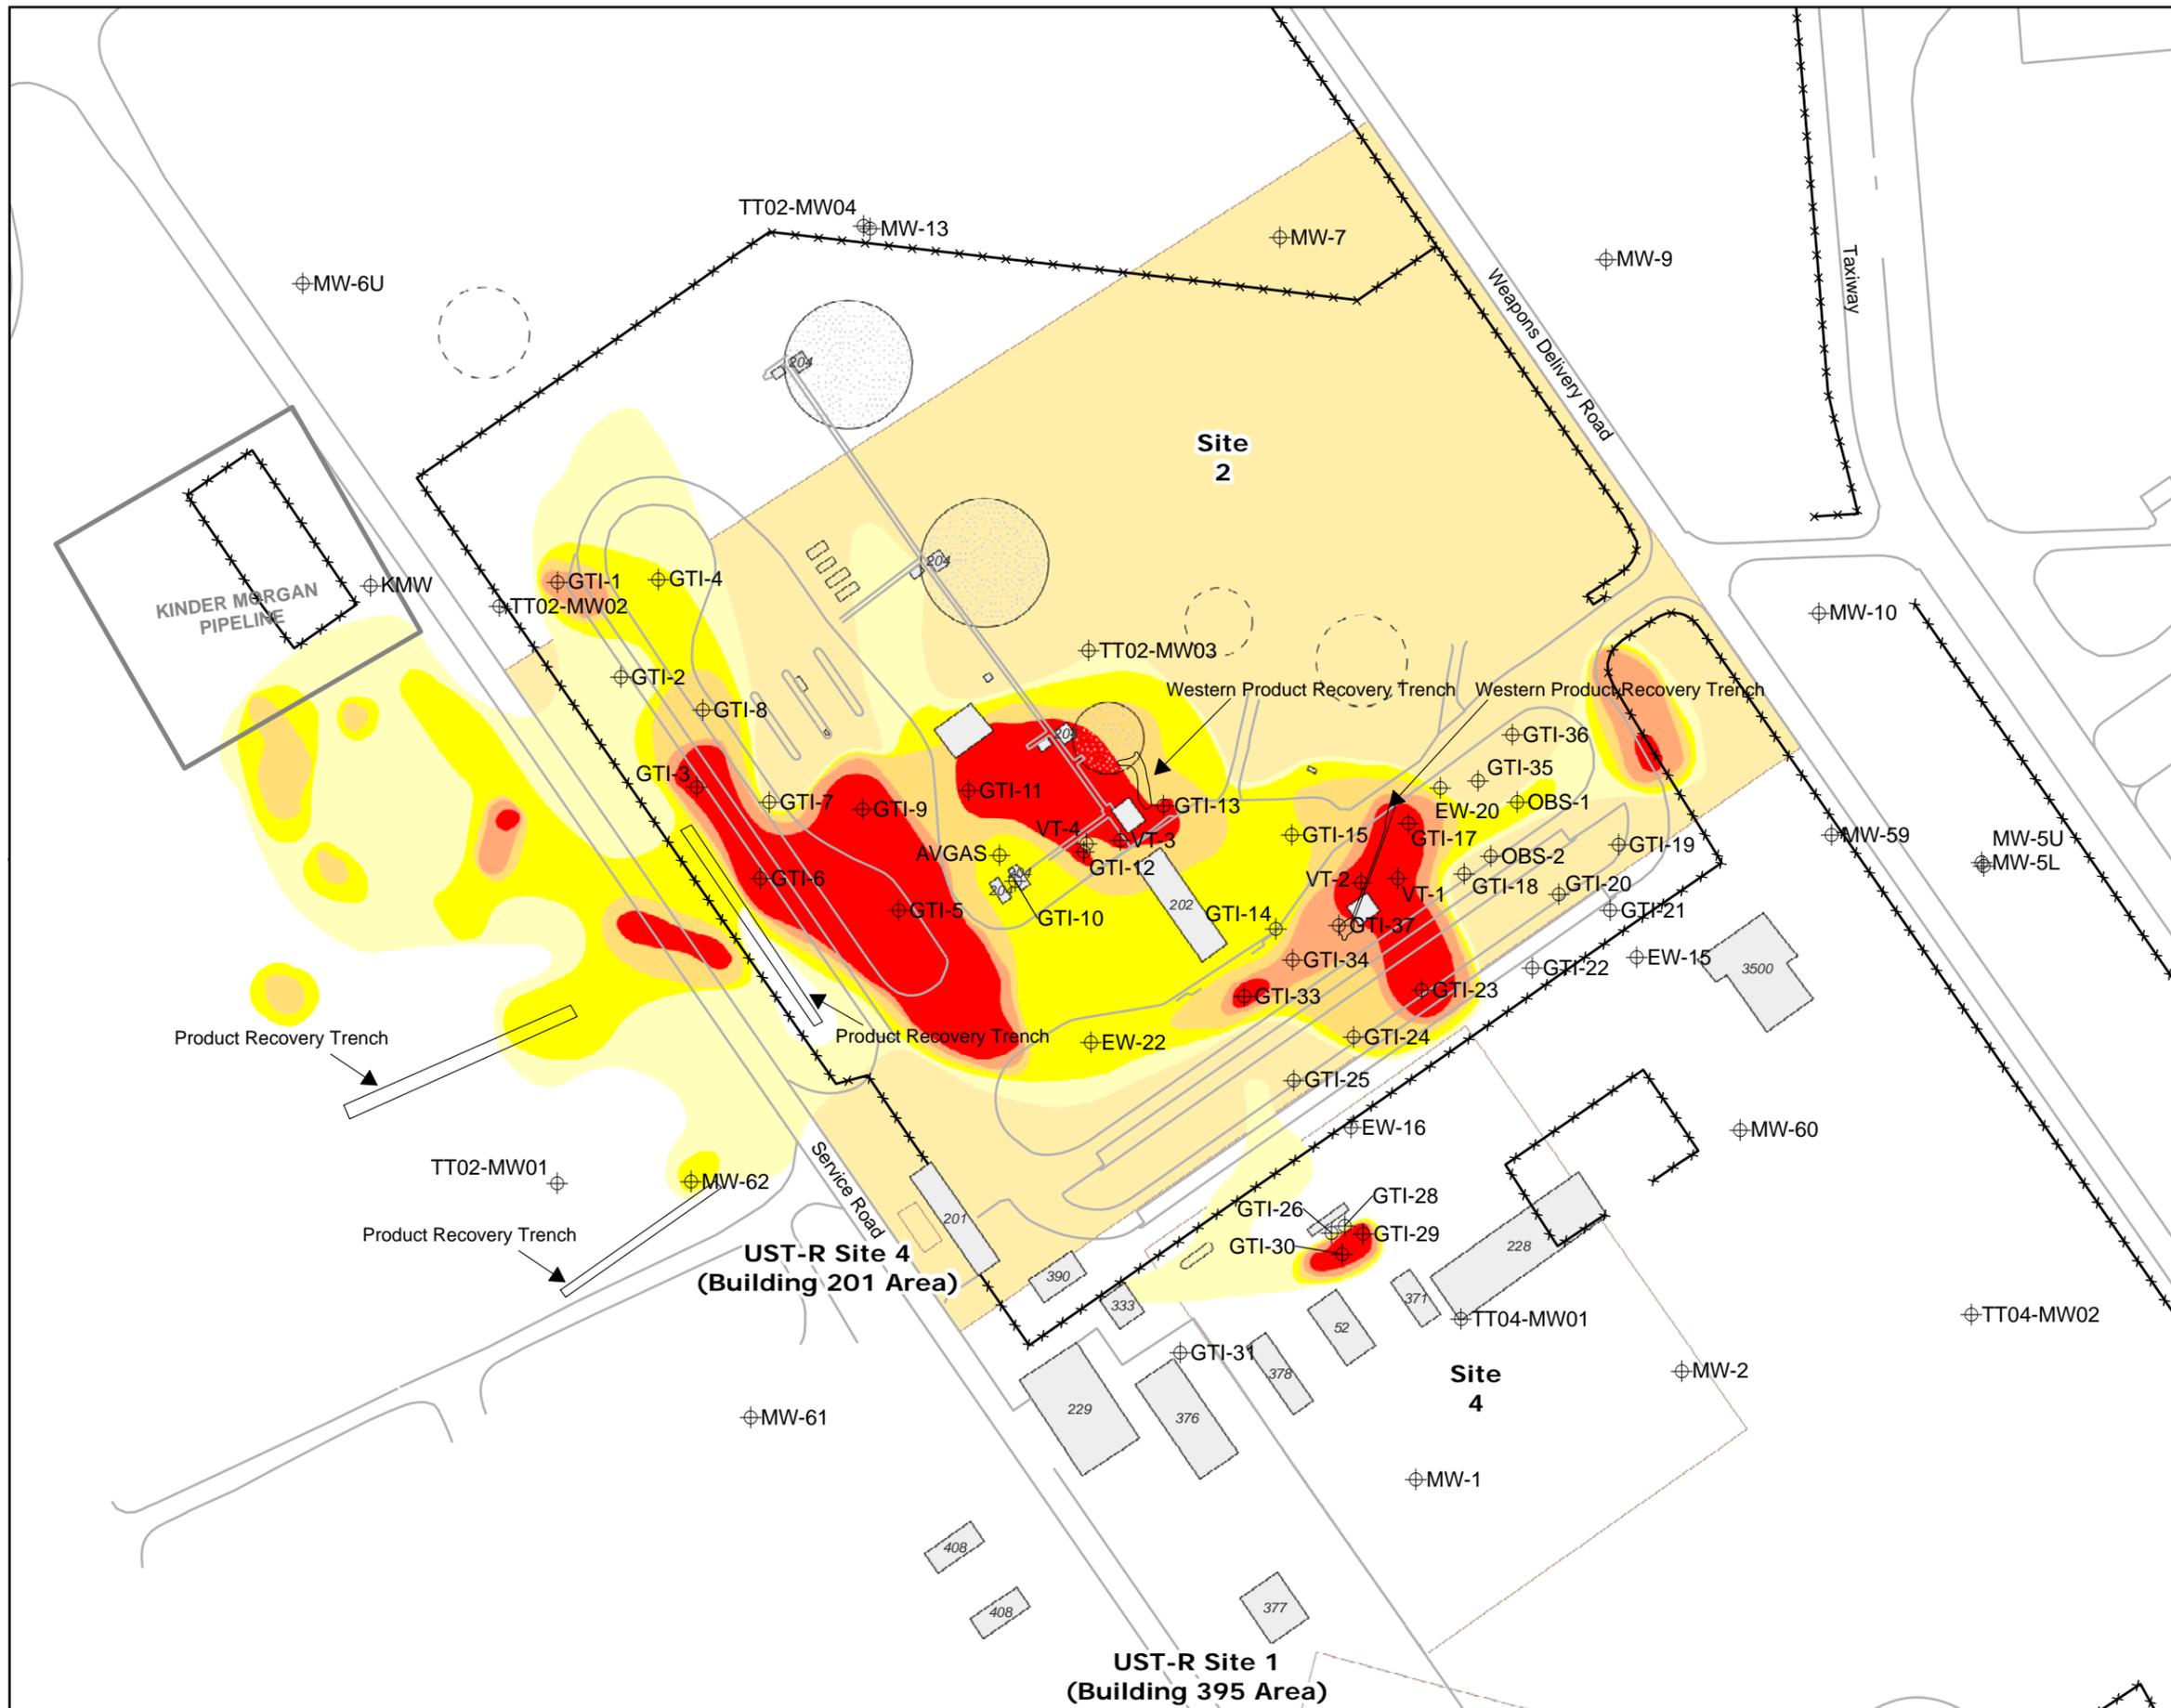

In addition to the UST removals, several remedial actions have been implemented at this site to remove free product including: (1) installation of a bioslurper system, which was operated from 1993 until 2001 where about 16,000 gallons of product were removed, (2) periodic removal of product from recovery wells installed in March 1992 using both portable and fixed skimmer pumps, and (3) product skimming from three recovery trenches installed in 1996 and two recovery trenches installed in 2008.

A pilot study was completed during August and September 2006 to assess the effectiveness of an internal combustion engine-powered multi-phase extraction system. However, the BTU content of the soil vapor was too low to operate the internal combustion engine without large amounts of supplemental fuel, making the technology not cost-effective.

In April 2007, new low-maintenance, free product skimmer pumps were installed in two wells and free product recovery was conducted weekly on approximately 20 wells using a portable recovery system.

In 2007, a SCAPS investigation delineated the extent of free product and smear zone. The SCAPS data along with historical analytical data were used to further delineate the free product plume and design an RI addendum/FS that is currently underway. Soil, groundwater, and soil gas data are being collected to update the risk assessment and identify a strategy for cleanup and site closure.

In 2008, two additional trenches were installed to optimize product removal. Beginning in August 2009, periodic (weekly) skimming from up to 22 wells and the two product recovery trenches has been conducted. Over 3,000 gallons of fuel have been removed from the wells and trenches since August 2009. Since the early 1990's, approximately 74,000 gallons of product have been removed from Site 2. Average site-wide product thickness has been reduced from 1.5 feet to 0.4 foot. Product skimming will continue and will be evaluated on a weekly basis to optimize fuel removal.

**SITE NUMBER:** 3

**SITE NAME:** NAS Fallon Hangar 1 Area

**REGULATORY PROGRAM:** CERCLA

**RELATED SITES:** 2/4 and UST-R Site 1 (Building 395 Area) (Northern OU includes Sites 2/4 and 3)

**DESCRIPTION:**

Site 3 is composed of several small sites located in the vicinity of Hangar 3. These small sites were former unpaved disposal areas for waste fluids. The northern areas, located north of Hangar 3 include the north aircraft fuel disposal (AFD) area, bowser disposal area, and the oil/water separator (OWS). The areas located south of Hangar 1 include the south AFD, ground support equipment (GSE) area, and the Wells air start building.

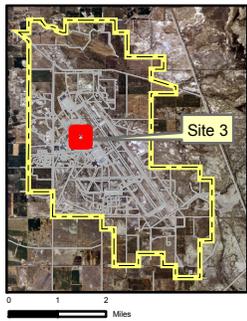

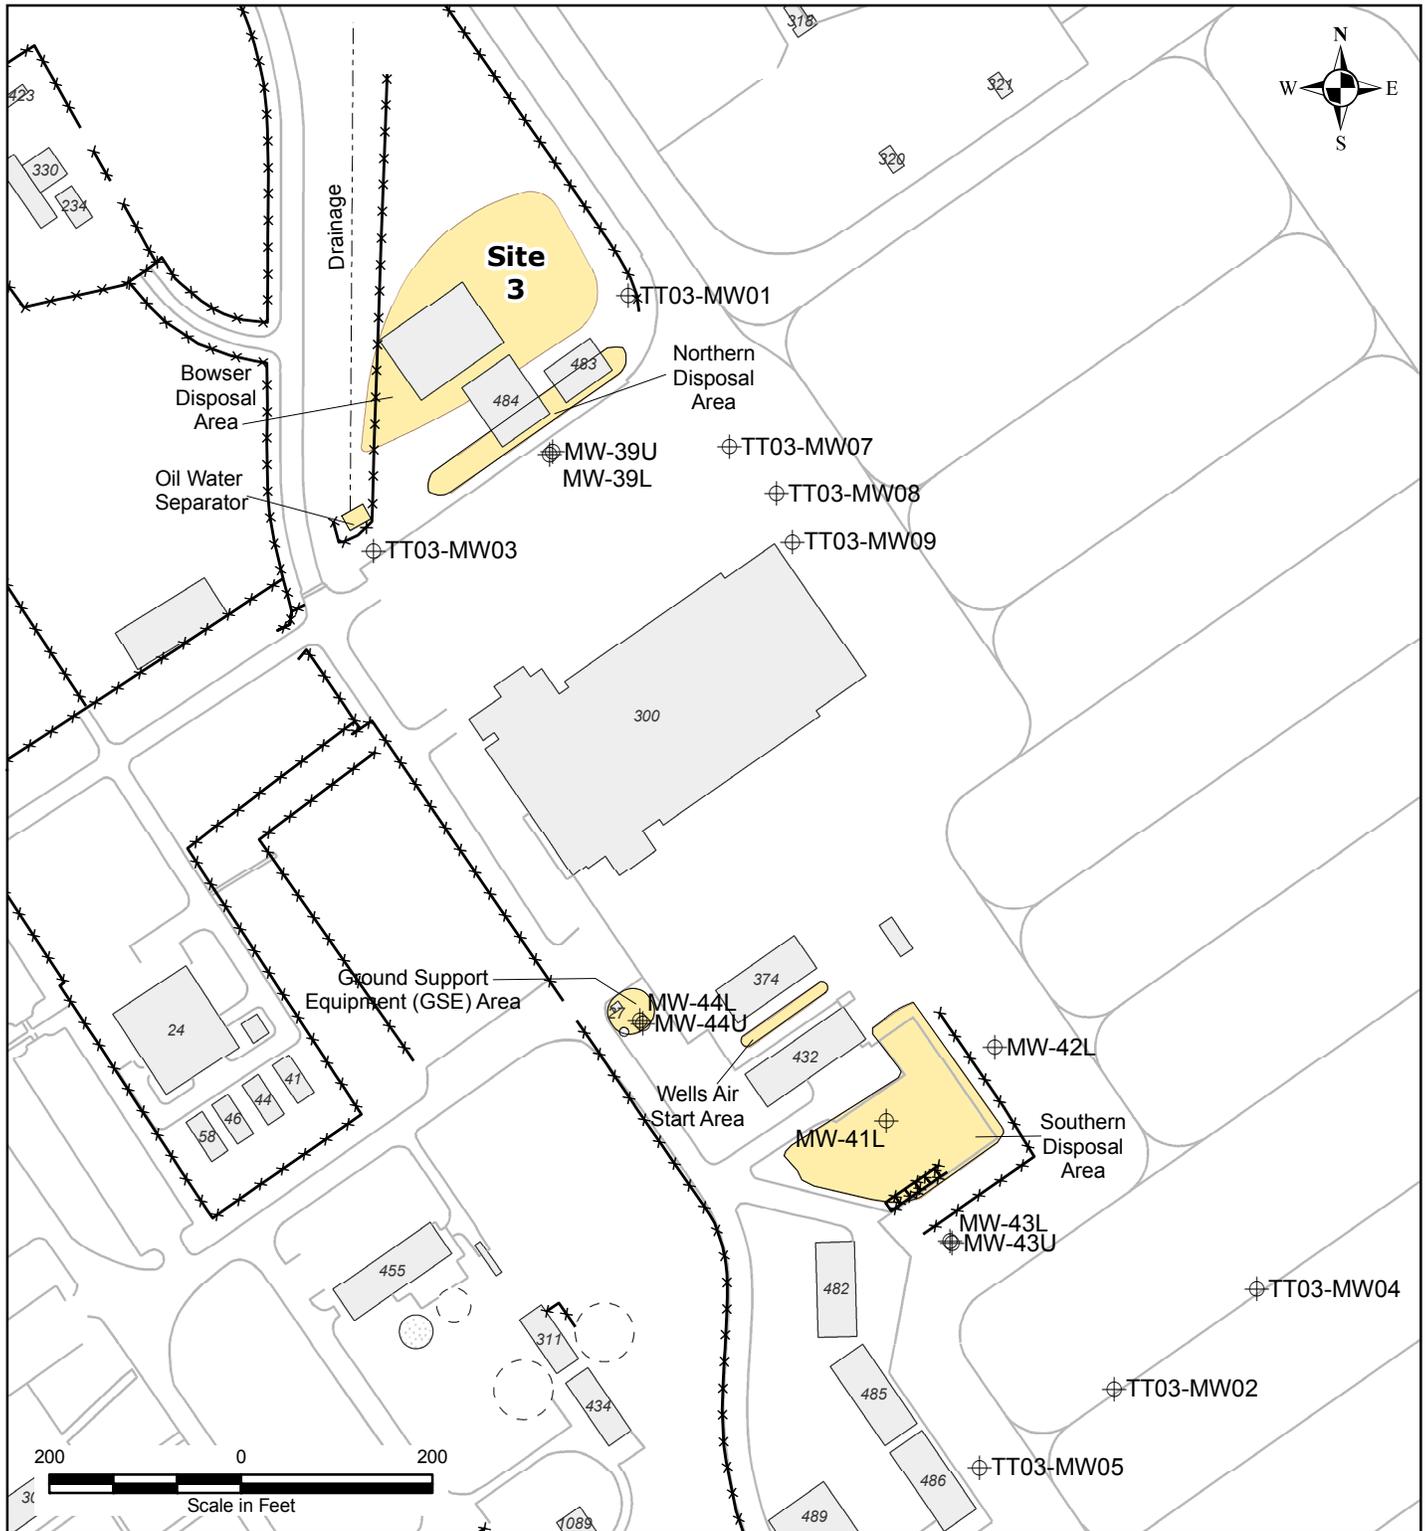

Fluids disposed of at these areas include JP-5, hydraulic fluid, lube oil, organic solvents (carbon tetrachloride, TCE, and PD-680), and cleaning solvents (Turco). The estimated amounts of fluid waste released to unpaved surfaces at Site 3 include 8,000 gallons at the north and south AFDs, 12,500 gallons at the bowser disposal area, 3,000 gallons at the OWS area, 1,350 gallons at the GSE area, and 750 gallons at the Wells air start building.

Previous soil sampling results from 1991 and 1999 indicate the presence of low-level VOC and TPH contamination. The solvents TCE, trans-1,2-DCE, and cis-1,2-DCE have been detected in groundwater.

**STATUS:**

An RI addendum\FS is currently underway. Groundwater and soil gas data are being

collected to update the risk assessment and identify a strategy for cleanup and site closure.

**SITE NUMBER:** 4

**SITE NAME:** NAS Fallon  
Transportation Yard

**REGULATORY PROGRAM:** Petroleum (Soil)  
CERCLA  
(Groundwater)

**RELATED SITES:** 2, 3 and UST-R Site 1  
(Building 395 Area)  
(Northern OU includes  
Sites 2/4 and 3)

**DESCRIPTION:**

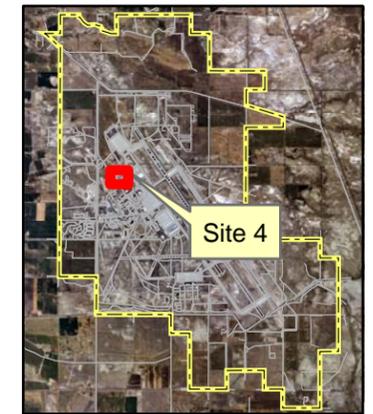

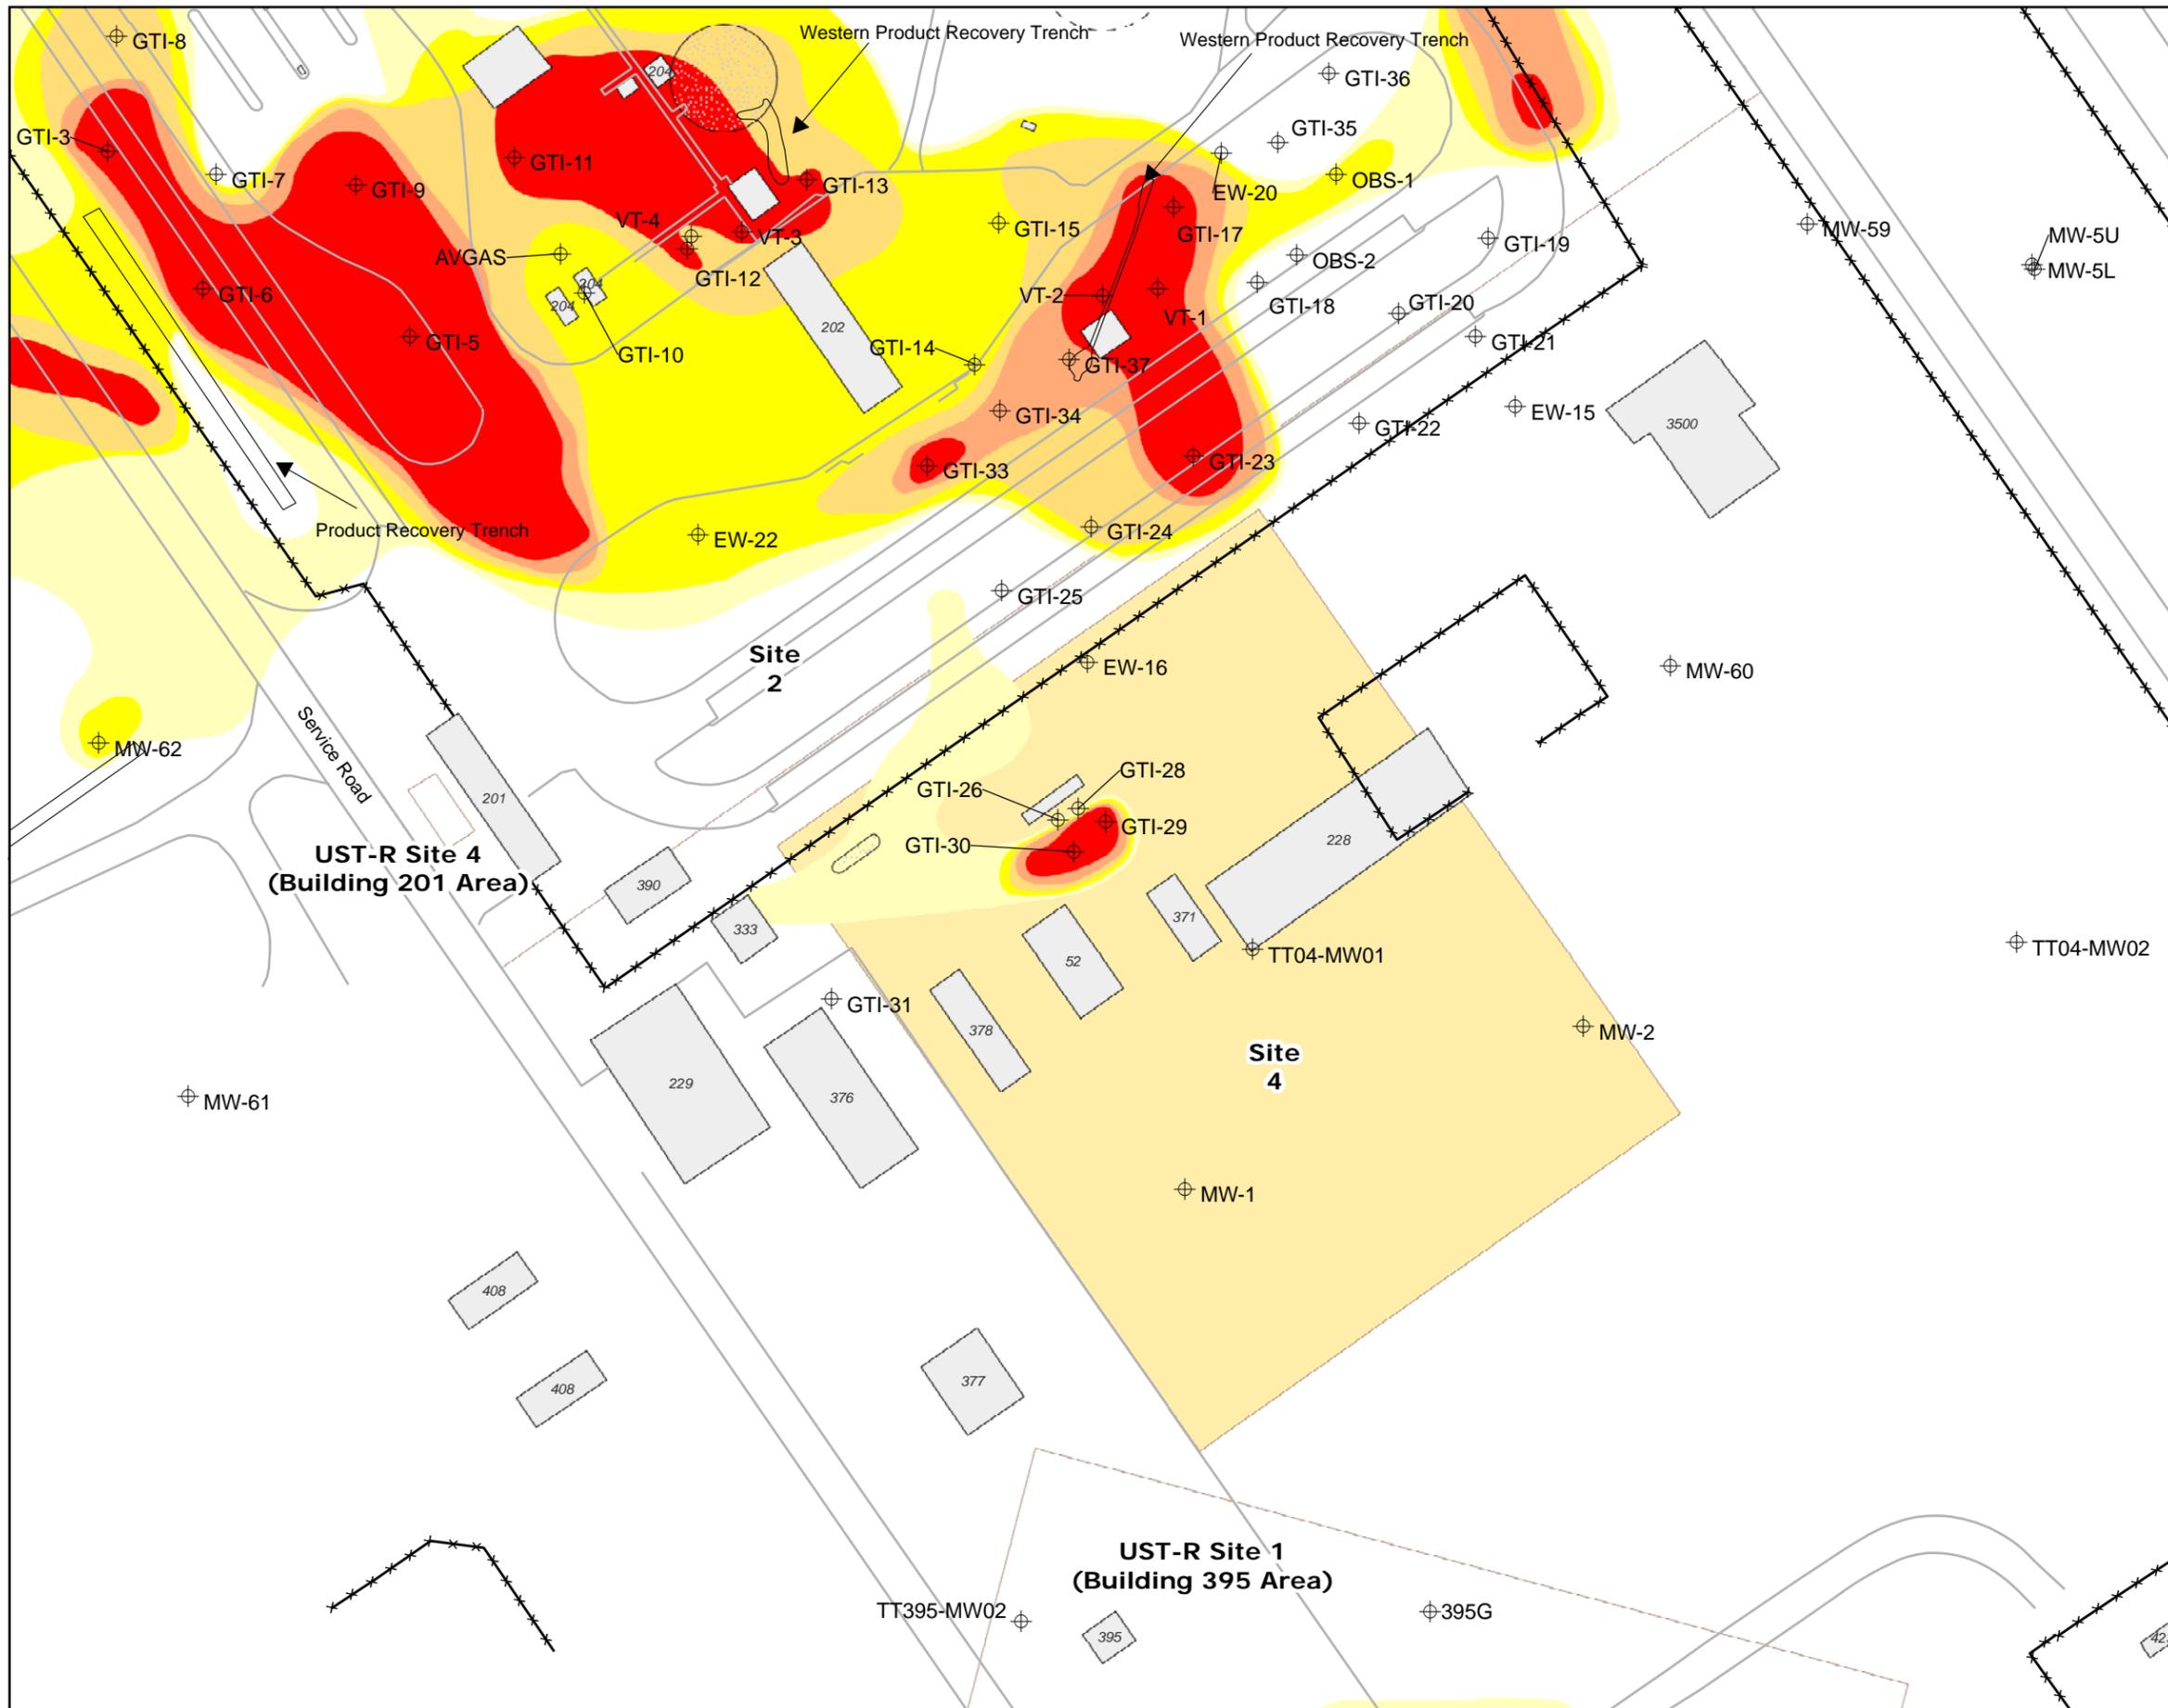

The Transportation Yard, located directly south of Site 2, consists of Building 371 and Building 378, which were used for vehicle maintenance, storage, and painting. Building 378 was used for painting and light overhaul operations from 1976 to 1981. An estimated 50 gallons of wastes, including radiator coolants, vehicle fluids, and paint wastes, were flushed into the drains in Building 378. Initially, it was thought the drains may have discharged to subsoils beneath the building; however, subsequent investigation revealed that they are plumbed to the sanitary sewer. An additional 400 gallons of waste fluids may have been spilled in the adjacent yard during vehicle repair from 1976 to 1981. The yard was not considered for further investigation beyond the PA/SI, and it was not recommended for inclusion as part of IR Site 4.

**STATUS:**

The Navy implemented a CAP. In March and April of 2005, 278 cubic yards of TPH-contaminated soil and associated piping was removed in the vicinity of IR Site 4 in the area

of a former aboveground storage tank and associated piping in the vicinity of IR Site 4. Remaining contaminated soil was left in place beneath permanent structures, such as fences, power poles, and building foundations. The Navy submitted a final closure report for Site 4 (SulTech 2007) that summarizes the soil removal and concludes that no further action is necessary for soil. Free product and impacts to groundwater observed at the site are considered a result of activities conducted at

upgradient Site 2. Impacts to groundwater at Site 4 will be addressed with Site 2. In 2007, a SCAPS investigation delineated the extent of free product and smear zone. The SCAPS data along with historical analytical data were used to design an RI addendum/FS that is currently underway. Soil, groundwater, and soil gas data are being collected to update the risk assessment and identify a strategy for cleanup and site closure.

**SITE NUMBER:** 5

**SITE NAME:** Ordnance Area

**REGULATORY PROGRAM:** CERCLA

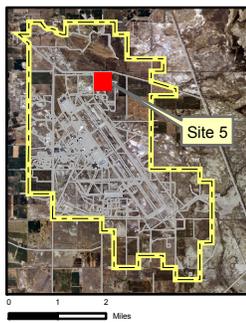

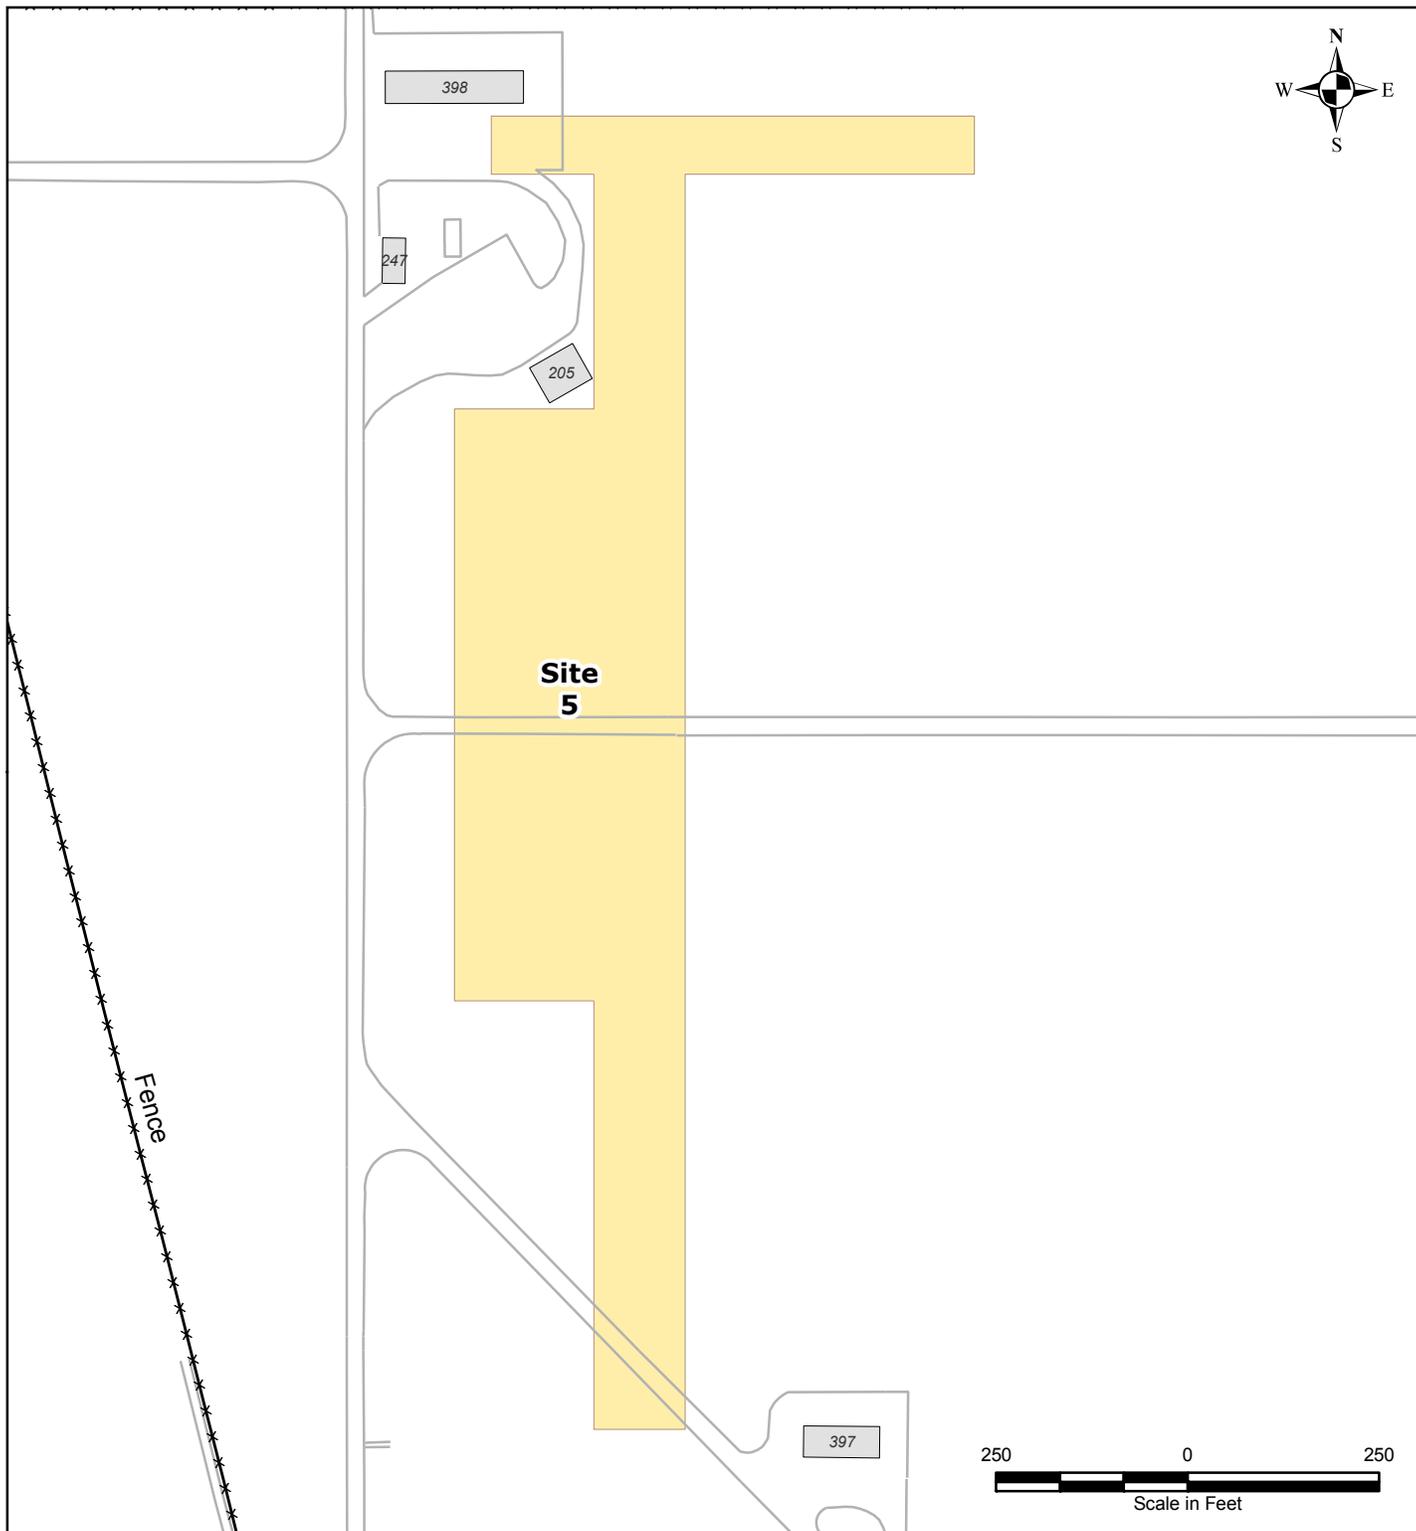

**RELATED SITES:** 24

**DESCRIPTION:**

The site consists of two adjacent disposal areas located in the northern portion of the base. The northern area was discovered in 1986 during excavation for a utility line and contained abundant metal debris and several decayed 20-millimeter ammunition shells. The material was excavated and removed to the base landfill, and the shells were disposed of off site by explosive ordnance detachment personnel. The southern area was used for disposal of inert packing material, consisting of pallets, metal boxes, strapping, ammunition cans, and cardboard. A no action decision was reached based on the PA/SI.

**STATUS:**

The site was closed with no action status in May 2001.

- Action Memorandum for Removal Action at Site 6, Defuel Disposal Area (ORNL 1996a)
- Comparison of Groundwater Alternatives Report (ORNL & AIMTech Lockheed Martin Energy Systems 2001)
- Public Health Assessment (ATSDR 2003)
- Data Summary and Recommendations Report Related to Focused Feasibility Study for Installation Restoration Program Sites (Battelle 2003a)

**SITE NUMBER:** 6

**SITE NAME:** Defuel Disposal Area

**REGULATORY PROGRAM:** Petroleum

**RELATED SITES:** 7, 8, 21, 22 and 24

#### DESCRIPTION:

The Defuel Disposal Area is located near the eastern boundary of NAS Fallon, midway between the north and south boundaries. The site consists of two areas 500 feet by 500 feet where off-specification fuel was disposed of to the ground surface between 1966 and 1972. It is estimated that 70,000 gallons of fuel, primarily JP-4 and JP-5, were dumped at the site and allowed to infiltrate to native soil.

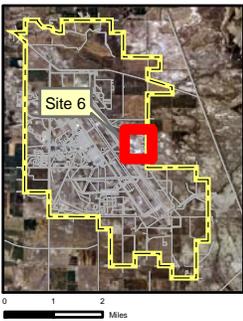

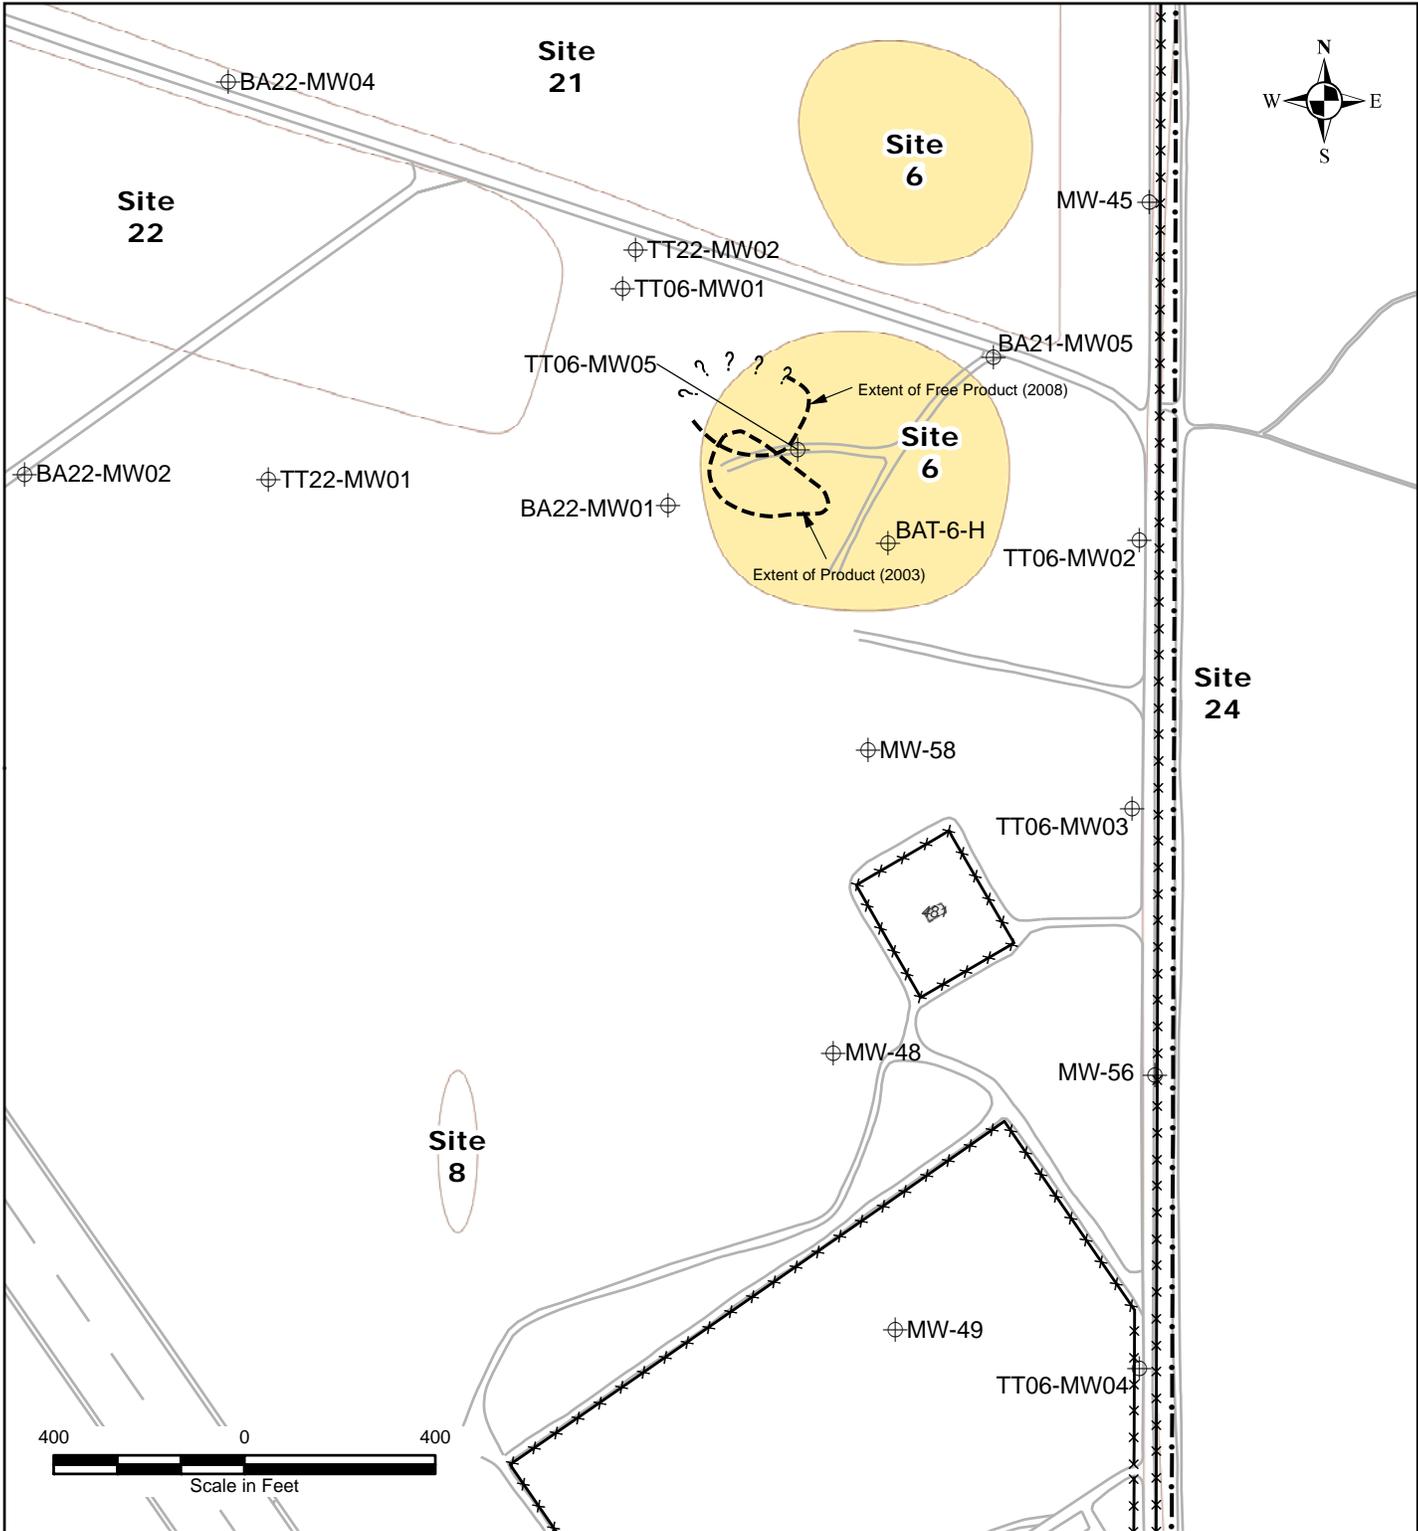

#### STATUS:

A number of monitoring wells and piezometers have been installed and sampled at the site, primarily at the southernmost area. Free product has been reported in past documents and has recently been detected during water level measurements in 2007 and 2008. The maximum product thickness was 0.94 ft. Previous sampling indicated fuel-related compounds in shallow groundwater, but minimal soil contamination. Only limited investigation has occurred at the northernmost area at Site 6. A passive soil gas survey conducted in August 2006 showed no significant soil gas detections at the northern area.

In 2007, a passive soil gas survey was used to prove that no contamination exists in the northern pump area. Historical data were used to design an investigation that is currently underway. Soil and groundwater data are being collected to update the risk assessment and identify a strategy for cleanup and site closure. Groundwater data collected since 2007 for the RI Addendum and basewide hydrologic investigation indicate that

petroleum compounds such as naphthalene  
have been detected at Site 6.

- Final Decision Document for Site 7, Napalm Burn Pit (URS 2002a)

**SITE NUMBER:** 7

**SITE NAME:** Napalm Burn Pit

**REGULATORY PROGRAM:** CERCLA

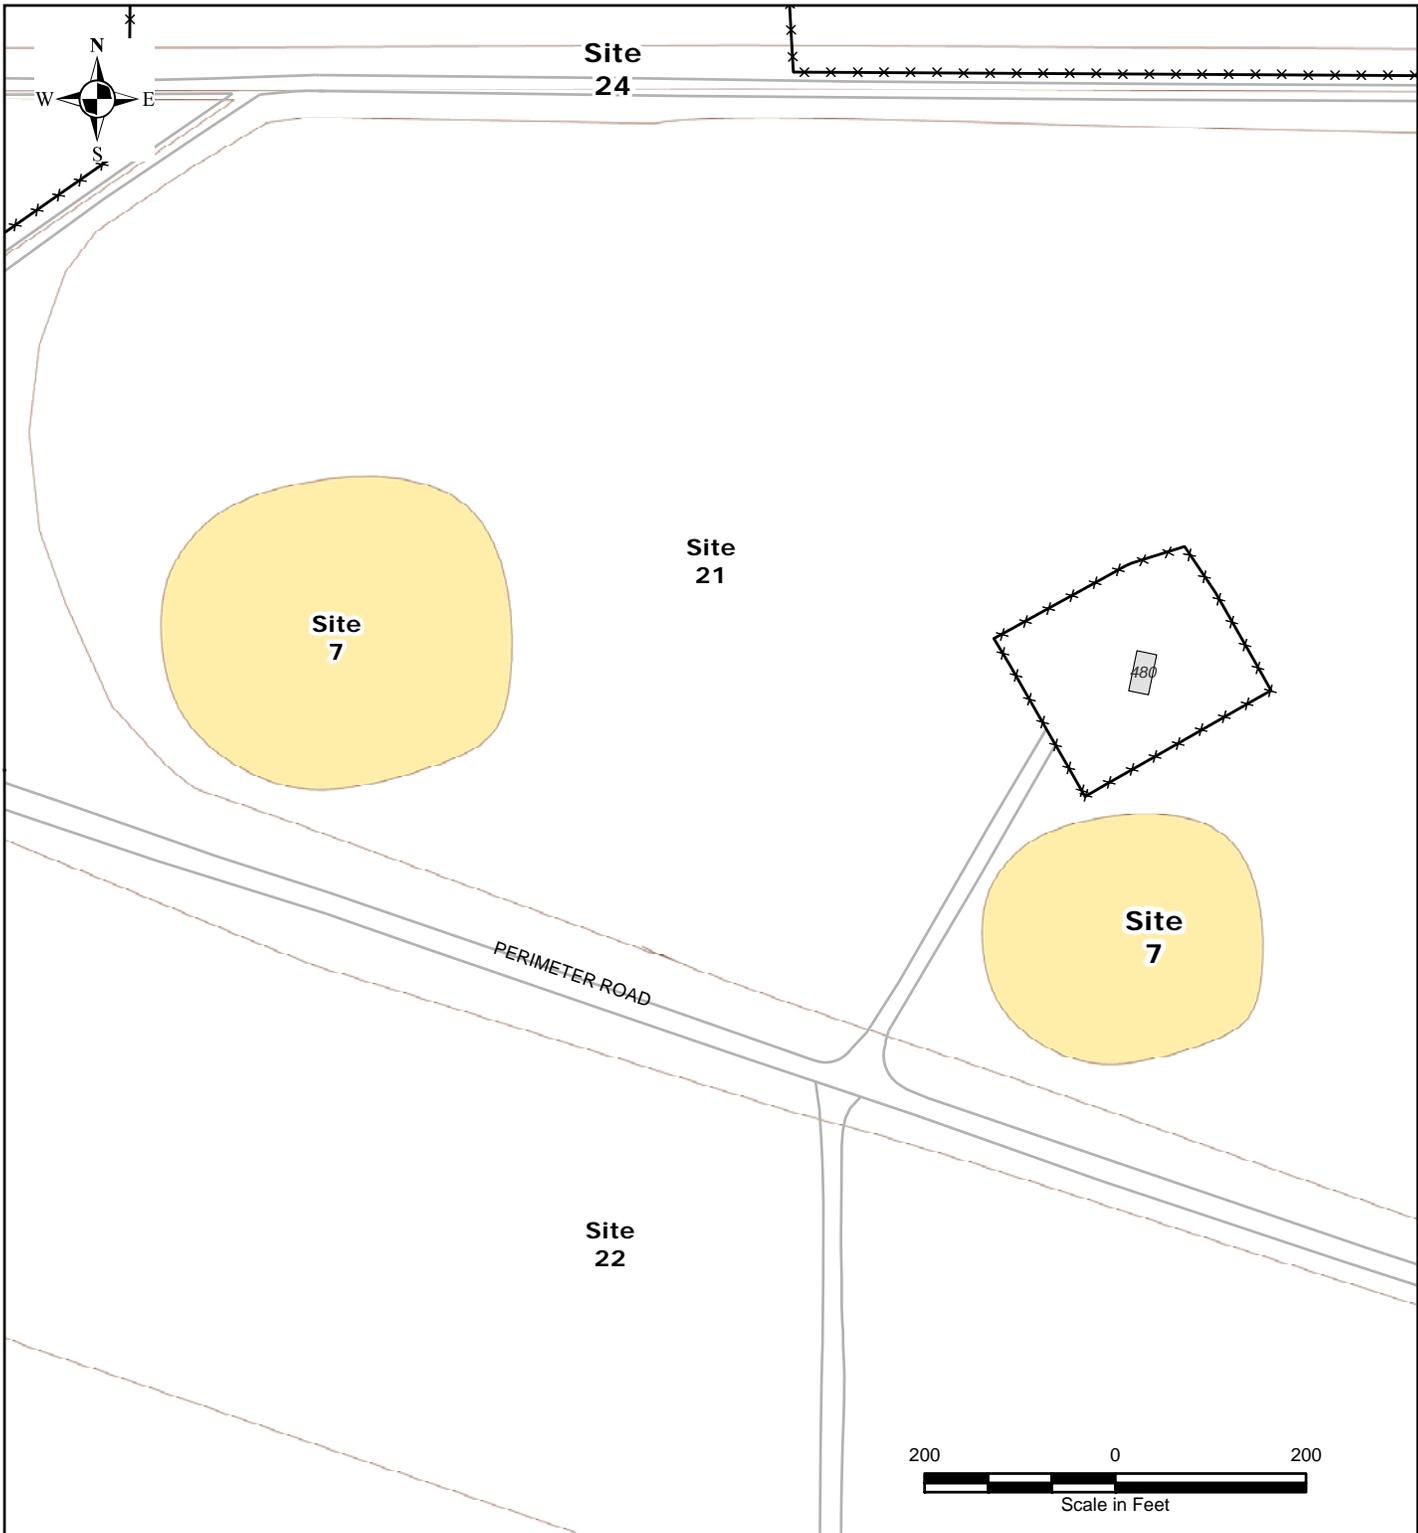

**RELATED SITES:** 6, 8, 21, 22, 24 and 28

#### **DESCRIPTION:**

The site is located in the eastern-central portion of the base. There were two suspected locations where napalm canisters were reportedly opened, covered with diesel fuel, and burned. The locations could not be identified during the PA/SI or on aerial photographs, however. A former NAS Fallon fire chief testified in 1991 that napalm was not burned in this area. The RI (ORNL 1994) recommended no action at the site because no evidence exists to support its presence.

#### **STATUS:**

The site was closed with no action status in June 2002.

**SITE NUMBER:** 8

**SITE NAME:** Bore Site Gunbutt

**REGULATORY PROGRAM:** CERCLA

**RELATED SITES:** 6, 7, 21, 22, 24, 25

**DESCRIPTION:**

The site is located in the east-central portion of the station and was used for sighting in aircraft-mounted machine guns from the 1940s to the 1960s. The Gunbutt was removed in 1987 as a result of grading for a new runway. It is likely that soils in the area were removed and redistributed along the course of the runway. The grading makes it unlikely that substantial lead remains at the site.

**STATUS:**

The site was closed with no action status in January 2001.

**SITE NUMBER :** 9

**SITE NAME:** Wastewater Treatment Plant

**REGULATORY PROGRAM:** CERCLA

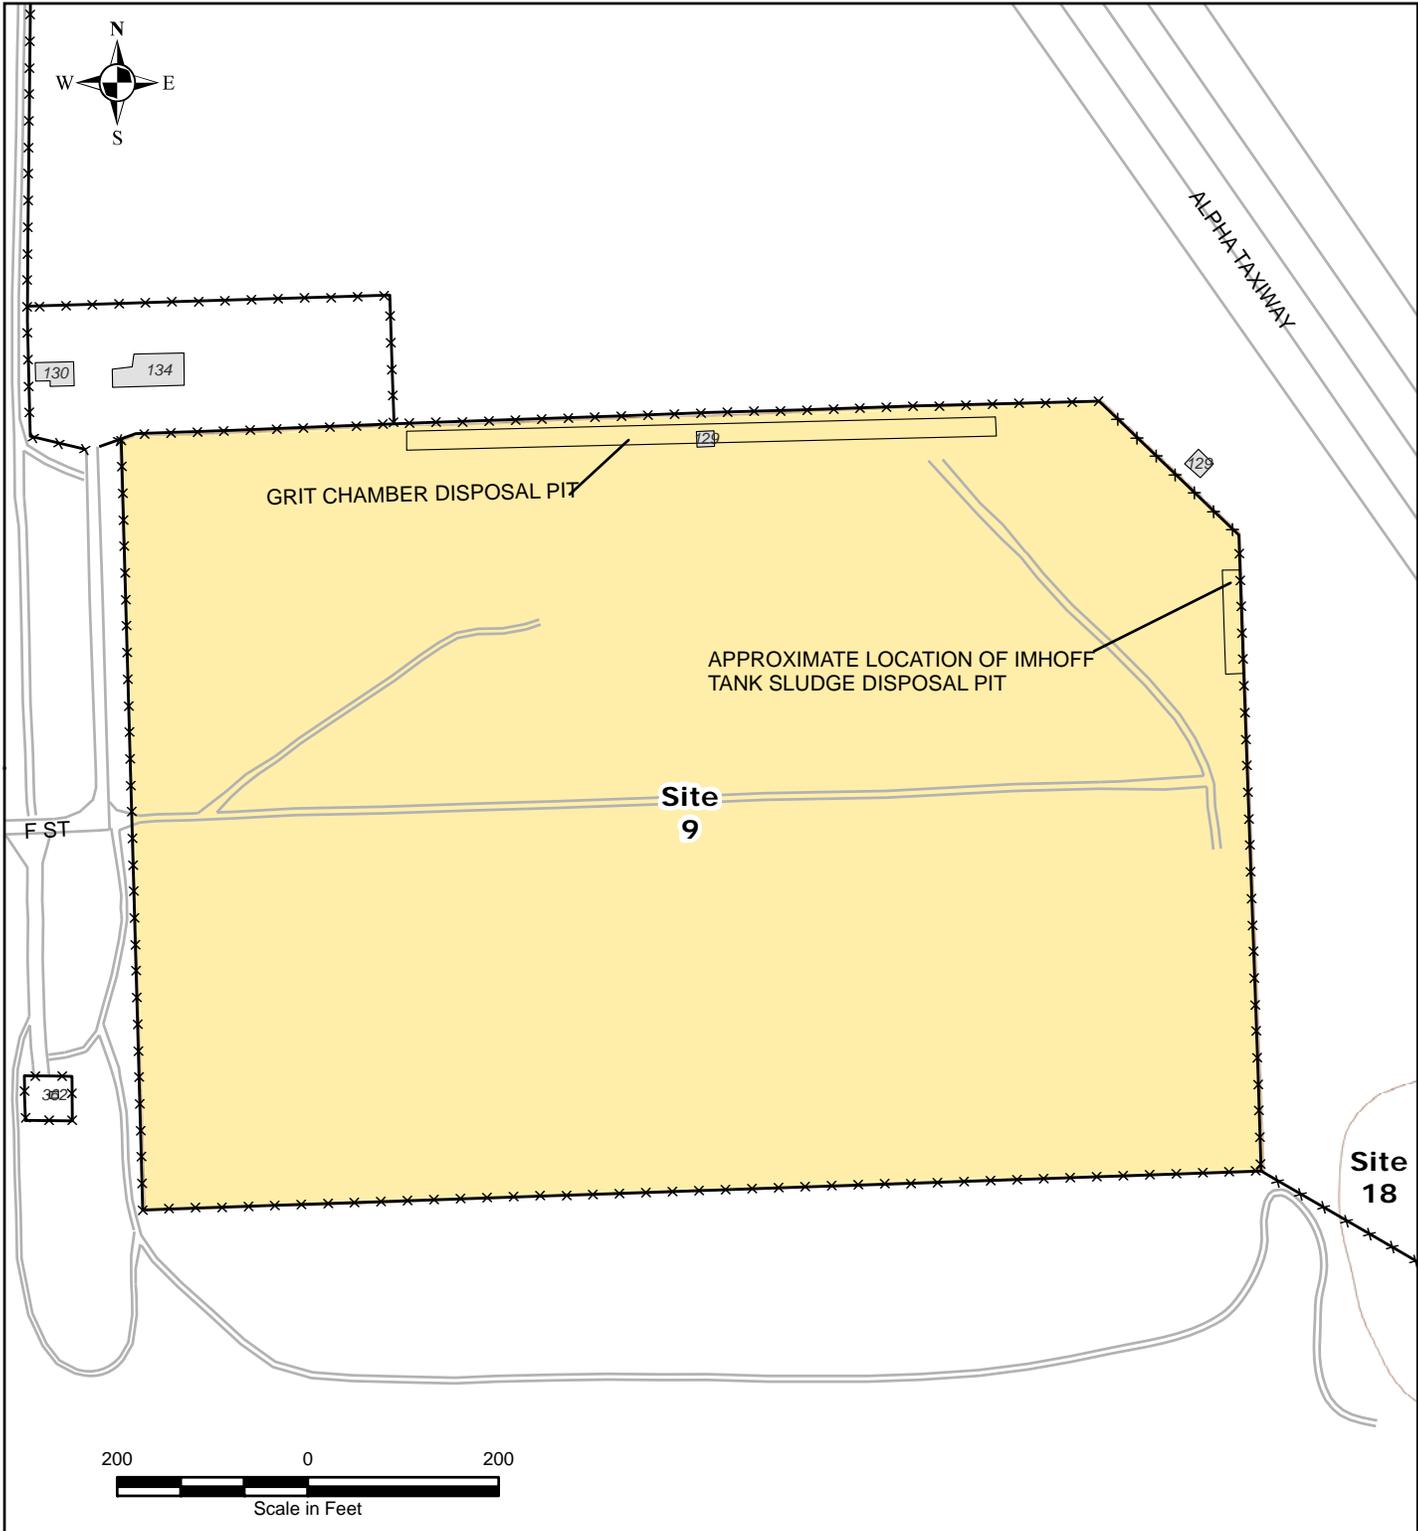

**RELATED SITES:** 16, 18, 19 and 24

**DESCRIPTION:**

The Wastewater Treatment Plant is located in the southeastern portion of the station and is the central treatment facility at the base, receiving wastes via the sanitary sewer. Wastewater treatment operations have occurred at the site from 1943 to the present. Potential contaminants of concern include hazardous materials removed from the sanitary discharge as grit, tank sludges, and contaminants in treated effluent. The site characterization did not identify contaminants of concern at concentrations that would require remediation.

**STATUS:**

The site was closed with no action status in November 2003.

**SITE NUMBER:** 12

**SITE NAME:** Pest Control Shop

**REGULATORY PROGRAM:** CERCLA

**RELATED SITES:** 1, 13, 14 and 16

**DESCRIPTION:**

The site is located in the southern portion of the base. Activities included handling and storing various pesticides. Additionally, a leach field that formerly operated just south of the pest control storage building received runoff generated from rinsing of pest control vehicles. Pest control operations have been moved to a different location on base, and Site 12 is no longer operational. The site characterization identified limited pesticide impacts to near-surface soil at concentrations that do not require remediation.

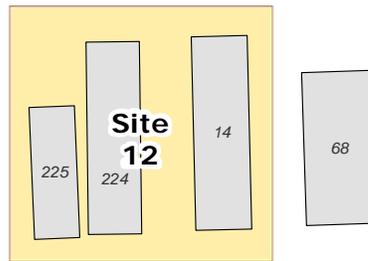

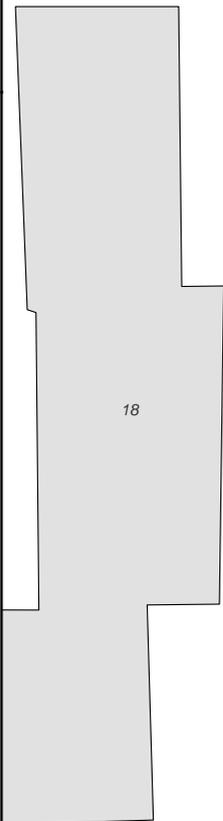

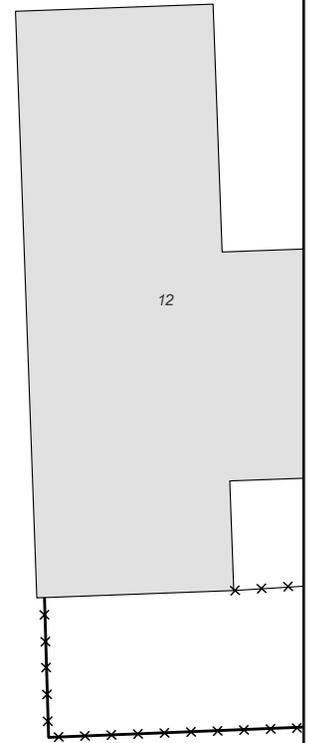

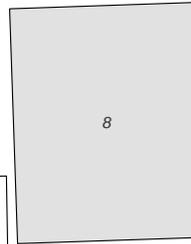

**STATUS:**

The site was closed with no action status in January 2005.

**SITE NUMBER:** 13

**SITE NAME:** Boiler Plant Tanks

**REGULATORY PROGRAM:** CERCLA

**RELATED SITES:** 1, 12, 14 and 16

#### **DESCRIPTION:**

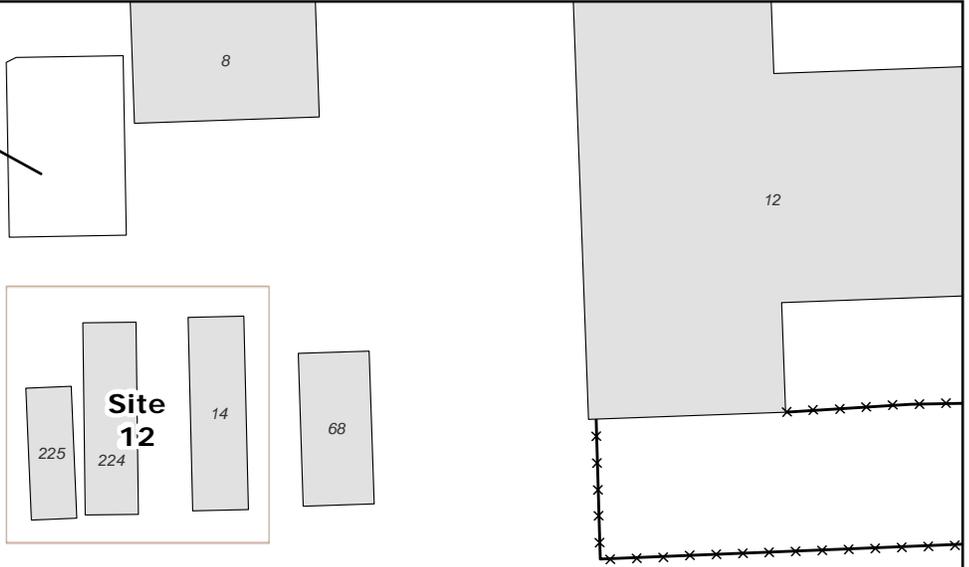

The site is located in the southern portion of the base and included two 26,000-gallon USTs used to store fuel for the boiler plant. Storage of fuel for the boiler plant was discontinued in 1981, after which the tanks were used for intermittent storage of other fuels and oils. Spills during tank filling operations may have consisted of No. 6 fuel oil, waste lubrication oil, hydraulic fluid, JP-5, and diesel fuel. The tanks were removed under the UST removal program in 1992.

#### **STATUS:**

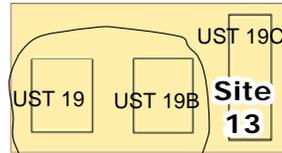

The site was closed with no further action status in May 1997.

**SITE NAME:** Old Vehicle Maintenance Shop

**REGULATORY PROGRAM:** CERCLA

**RELATED SITES:** 1, 12, 16 and 17  
(Southern OU includes Sites 1, 14, and 16)

#### **DESCRIPTION:**

The site consists of a concrete slab that served as the foundation for a mechanics bay, fueling area, and support building. The facility was used from 1943 to 1971, except for 1947 to 1950, when operations were closed. From 1971 to 1973, the building reportedly served as the auto hobby shop. The shop was demolished sometime after 1973. Two USTs at the site stored leaded gasoline and diesel fuel. The tanks were removed in 1989 and were found to have been leaking petroleum hydrocarbons into the soil. Excavated soil was backfilled into the pits.

#### **STATUS:**

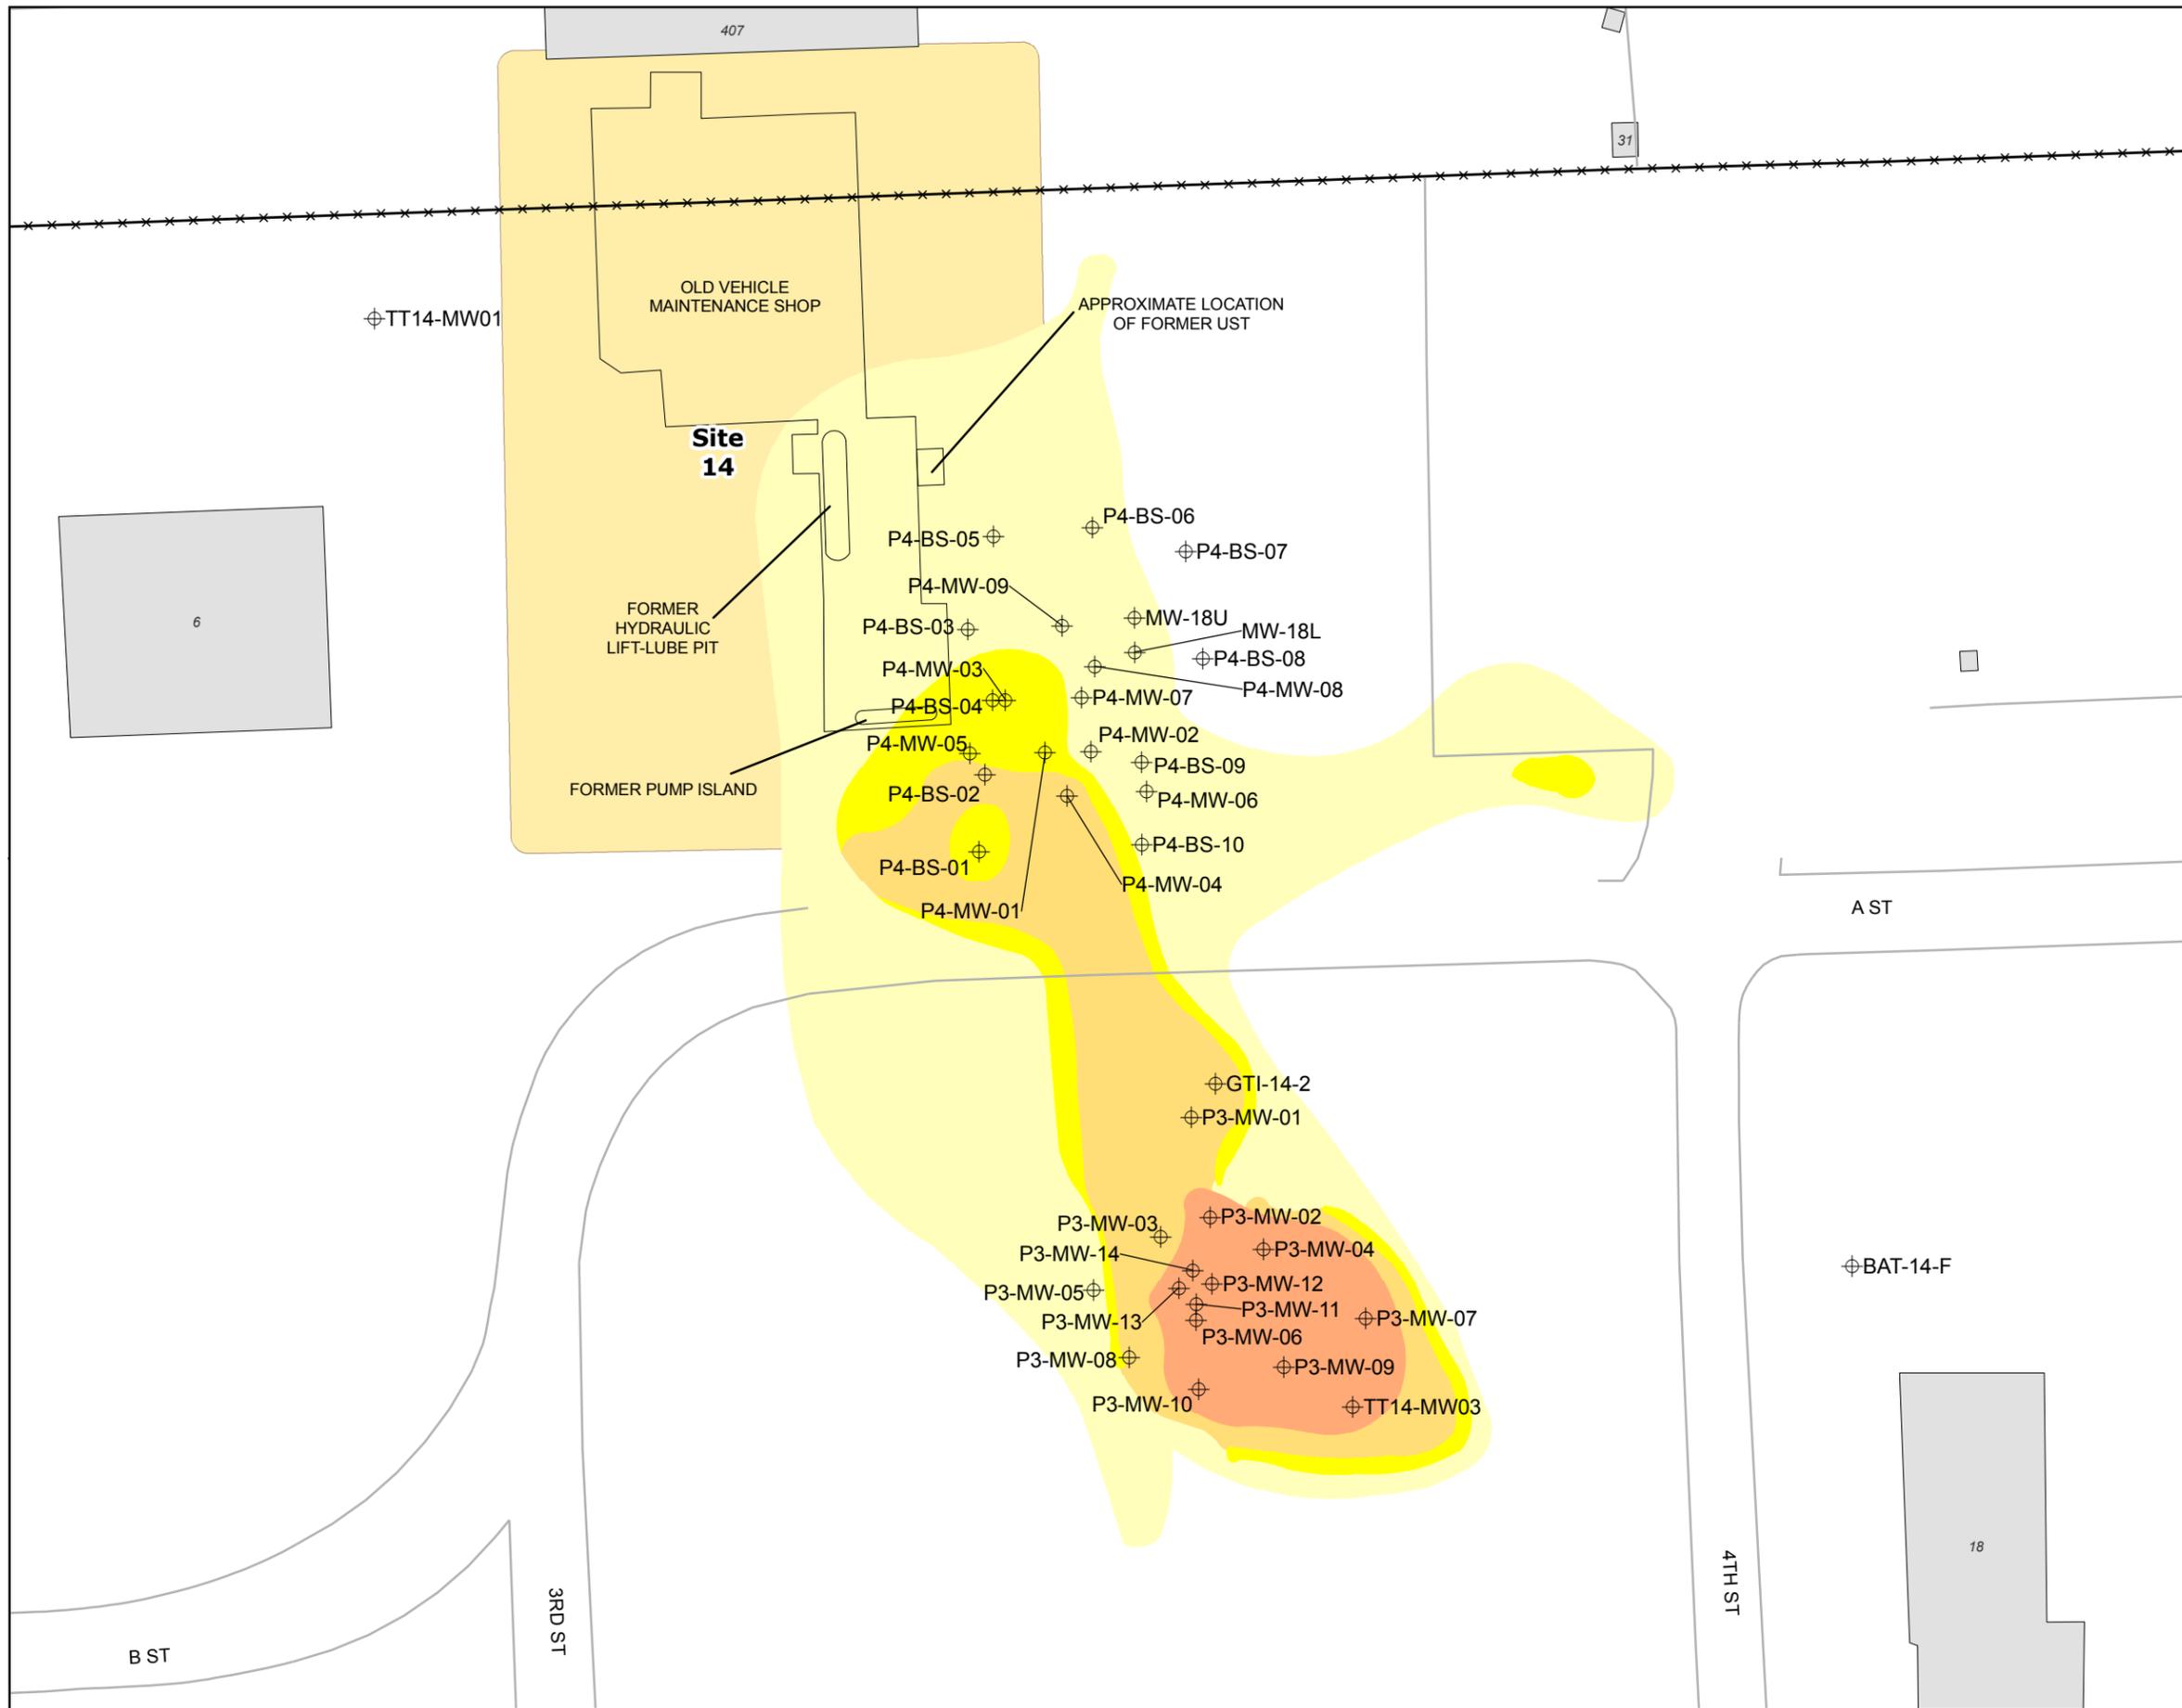

Approximately 130 gallons of petroleum have been recovered from the site, primarily using bailing and passive skimming. The chief concern at the site is floating fuel product and groundwater contaminated with petroleum hydrocarbons. Previous studies have shown that soil contamination is confined to the smear zone.

Pilot studies were conducted at Site 14 between August 26, 2002 and May 15, 2003 to evaluate selected technologies for treating fuel-derived hydrocarbons. Enhanced in situ aerobic bioremediation was not found to be effective at Site 14 due to the presence of free product; however it was thought that in situ aerobic bioremediation may be effective on dissolved phase contamination only. Similarly, in situ AS/SVE was not found

effective in the presence of free product but could be effective on dissolved phase contamination. In general, air stripping was found to be an effective technology for treating fuel hydrocarbon contamination in extracted groundwater; however total petroleum hydrocarbons as diesel (TPH-d) was not effectively removed by air stripping alone. The effectiveness of the selected technologies of these pilot studies are

detailed in the Final Groundwater Pilot Studies (Battle 2004b).

In 2007, a SCAPS investigation delineated the extent of free product and smear zone. The SCAPS data and historical data were used to design an RI addendum/FS that is currently underway. Soil, groundwater, and soil gas data are being collected to update the risk assessment and identify a strategy for cleanup and site closure.

**SITE NAME:** NAS Fallon Old Fuel Farm

**REGULATORY PROGRAM:** CERCLA

**RELATED SITES:** 1, 9, 10, 11, 12, 13, 14, 17, 19 and 23 (Southern OU includes Sites 1, 14, and 16)

**DESCRIPTION:**

Site 16 is the Old Fuel Farm that included four concrete 50,688-gallon USTs located immediately east of Hangar 7. The Old Fuel Farm was the primary fuel storage area and distribution area from 1943 until 1962. The tanks were used for dead storage of various fuels from 1963 to 1985. The tanks were excavated in 1992.

Fuels stored at the Old Fuel Farm included avgas, JP-4, JP-5, diesel fuel, gasoline, and No. 6 fuel oil. Early estimates cite the potential release of up to 9,000 gallons from leaks or spills. Operations at the site resulted in petroleum hydrocarbon impacts to soil and groundwater.

A plume containment system was in operation from 2004 to 2007 to reverse the direction of groundwater flow away from the E4X drain which ultimately flows to the Lower Diagonal drain. The Lower Diagonal drain flows to the Stillwater Reservoir and Wildlife Preserve drain. A previously unidentified chlorinated solvent source was identified northwest of the E4X drain in 2006. The Navy completed a technical evaluation of the plume containment system in 2006 and concluded that it was only marginally effective and had the potential to mobilize contamination toward the E4X drain. The Navy decommissioned the plume containment system in January 2007.

The Navy installed sentinel groundwater monitoring wells, pressure transducers, and velocity flow sensors to verify that chlorinated solvents in groundwater are not adversely

affecting the surface water in the E4X drain. In 2009, quarterly surface water samples were obtained from one location in the Lower Diagonal drain downstream of the E4X drain outfall and in 2010, sampling frequency increased to monthly. No solvents have been detected in surface water samples to date.

**STATUS:**

Several field activities have occurred at Site 16 as part of the IRP to identify additional sources and further delineate known areas of contamination. A passive soil gas survey, conducted in August 2006, identified a localized solvent source in the northwest portion of Site 16 investigation area emanating from a small debris pile 300 feet upgradient from the E4X drain. In August 2008, a second passive soil gas survey indicated a potential second solvent source at the E4X drain. An estimated volume of approximately 0.5 gallons was disposed at the debris pile and 2.5 gallons of solvent was disposed at the drain, each likely from a single event.

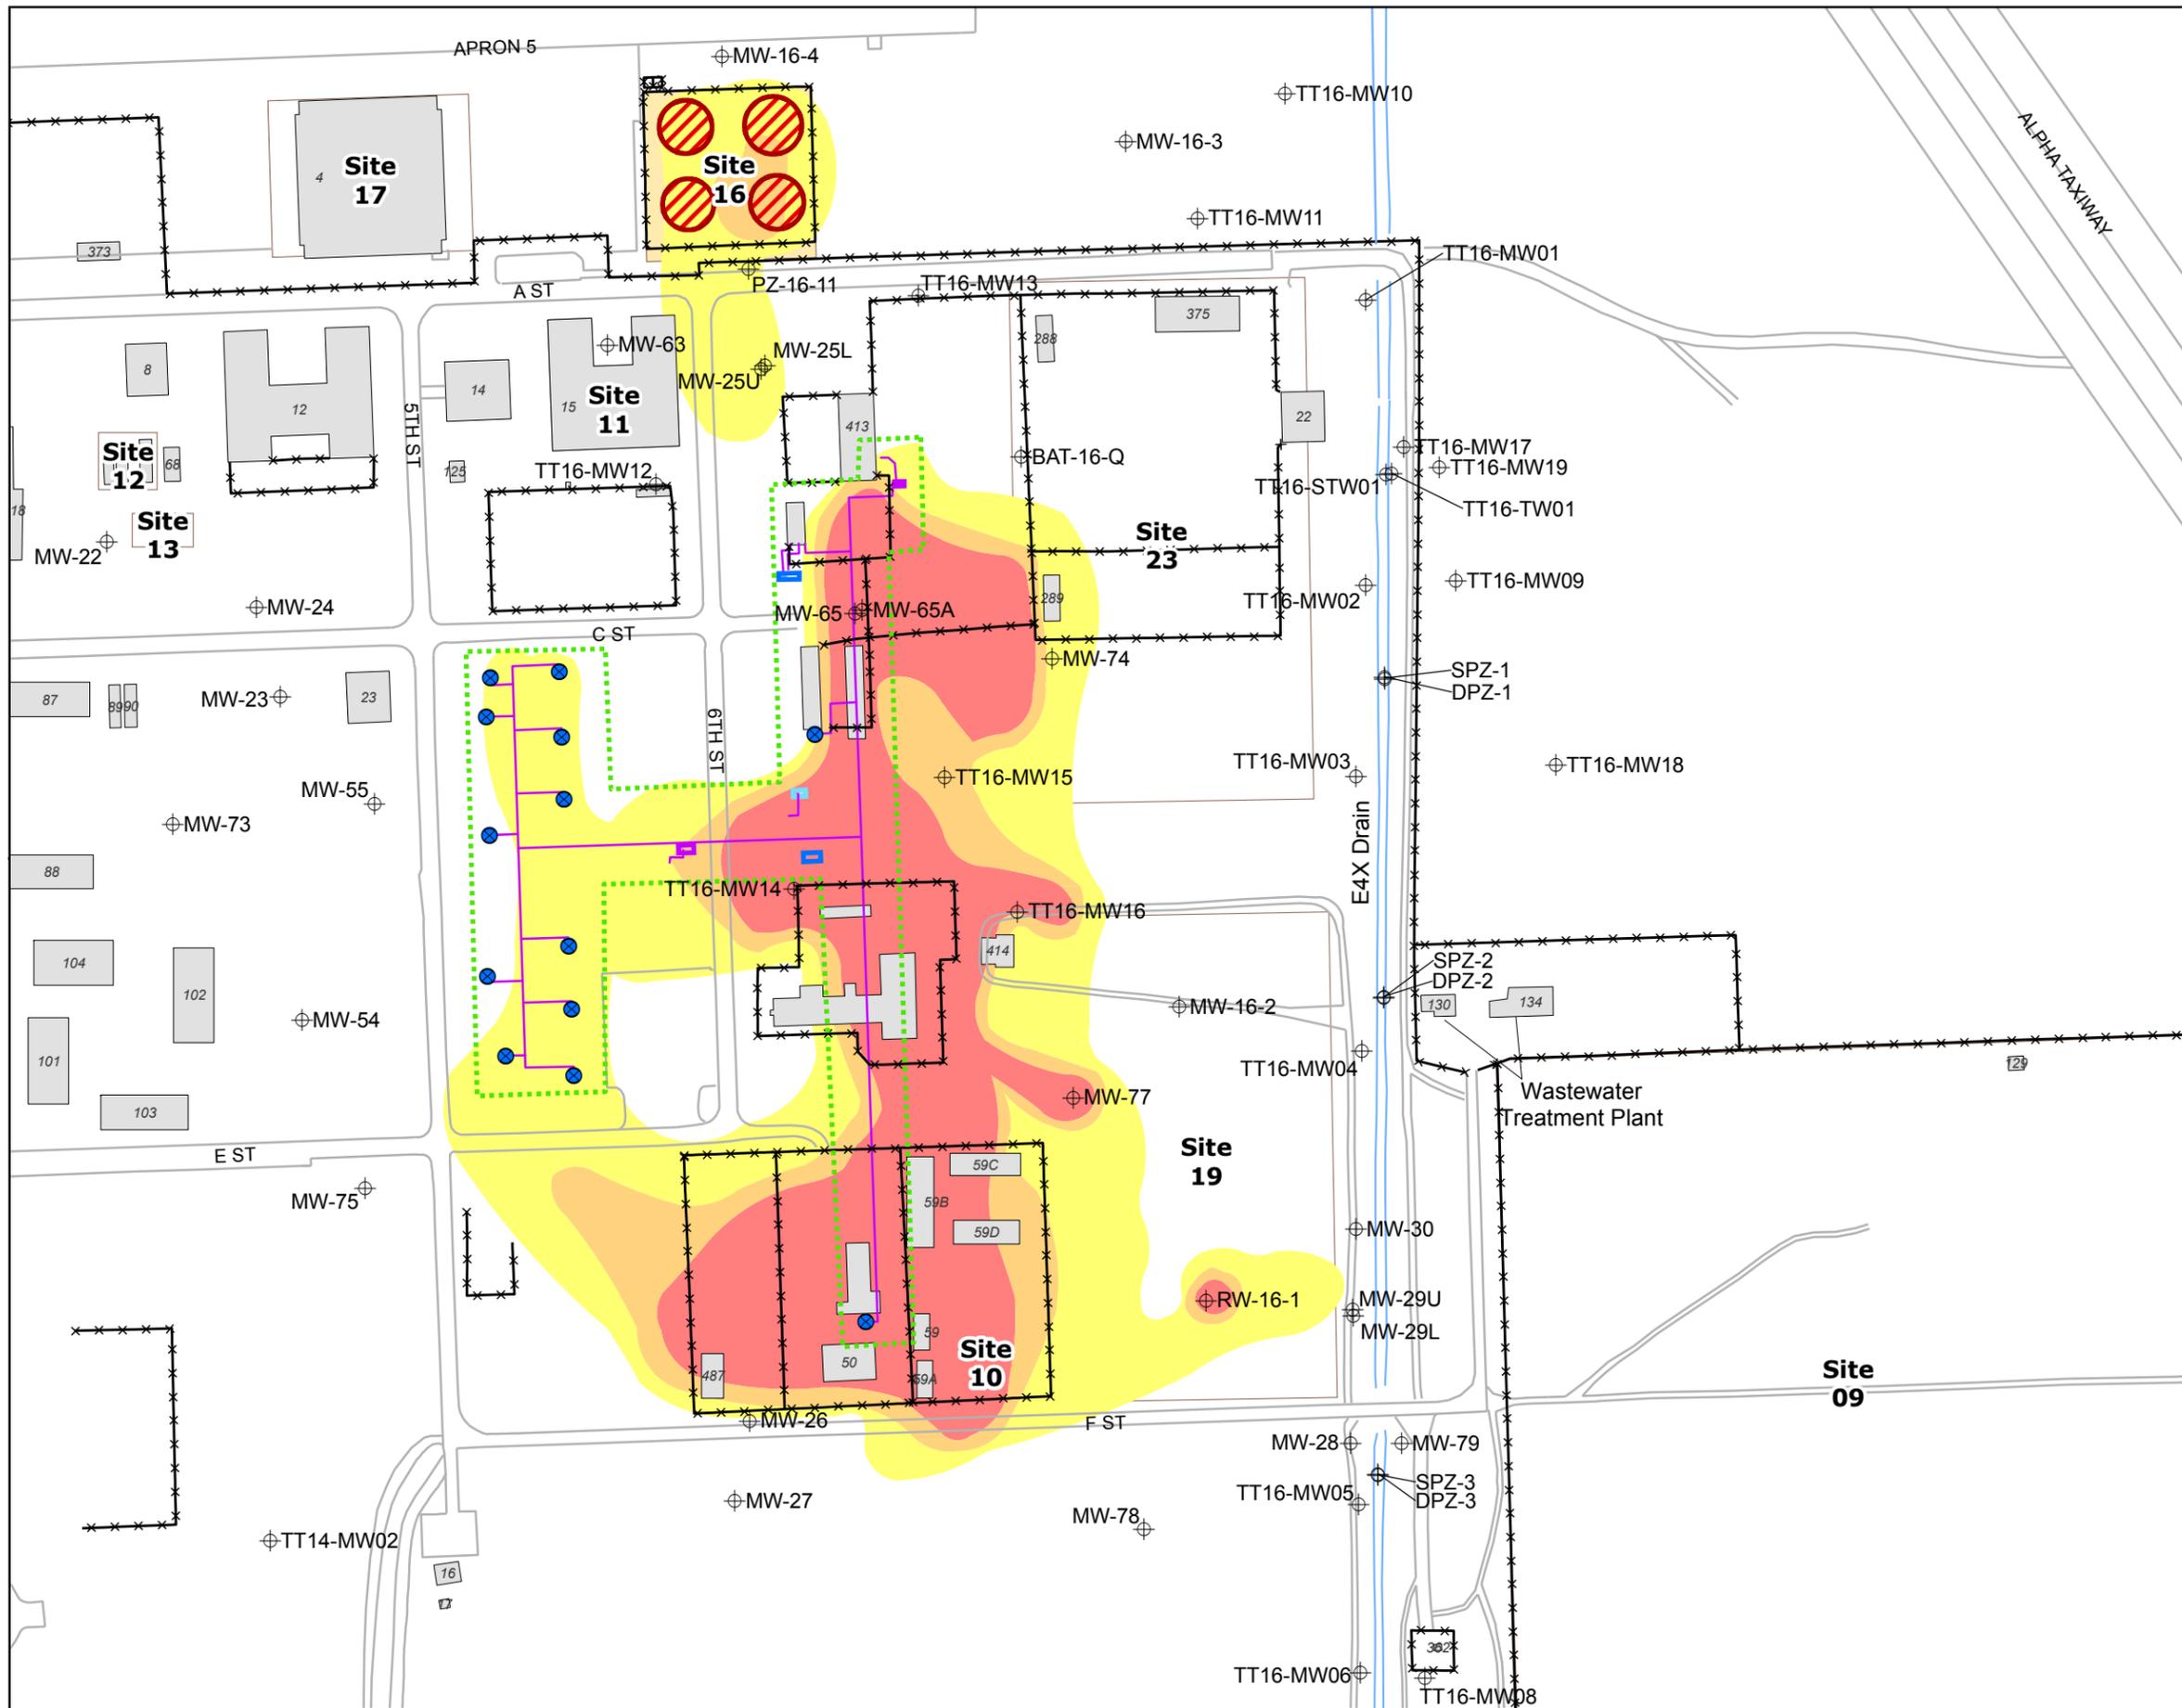

A SCAPS investigation, conducted during winter 2007, further defined the extent of free product and the smear zone and identified a fuel oil pipeline as a potential new source west of the E4X drain.

An additional 2008 passive soil gas survey, along with a geophysical investigation, identified the pipeline location and areas of floating product and soil contamination associated with the pipeline south of the original Site 16 fuel farm. This pipeline will be addressed under the petroleum program.

An AS/SVE pilot test was completed in October 2009 to obtain design parameters for a full-scale groundwater treatment system. The results of the pilot test indicate that SVE is technically feasible, but not cost effective, and that air sparging is feasible and cost effective.

The Navy plans to complete a TCRA in 2011. The Navy intends to partially backfill a portion of the E4X drain prior to implementation of the groundwater treatment system. The backfilling will remove the potential pathway for groundwater contaminants to affect surface water in the E4X drain, as well as downstream in the Lower Diagonal drain. However, if concentrations of chlorinated solvents are detected in the monthly surface water samples that are not protective of human health, the Navy will consider an emergency removal action.

The SCAPS data and historical data were used to design an RI addendum/FS that is currently underway. Soil, groundwater, and soil gas data are being collected to update the risk assessment and identify a strategy for accelerated cleanup and site closure.

- Final Aldrin Letter Report (Tetra Tech 2010c)

**SITE NUMBER:** 18

**SITE NAME:** NAS Fallon Southeast Runway Landfill

**REGULATORY PROGRAM:** CERCLA

**RELATED SITES:** 9 and 24

#### **DESCRIPTION:**

Site 18 is located near the southeastern corner of the wastewater treatment facility (Site 9) and near the southwestern corner of the flight taxiway. An irrigation drain, the Lower Diagonal drain, flows 100 feet south of the site. It is reported that basewide municipal refuse and industrial trash were buried at the site from 1943 to 1946. A total of four trench locations are suspected on the west side of the Site 9 boundary based on a 1952 topography map and historical photos. It is thought that material was buried in these bulldozed trenches above the water table, which is less than 10 feet below ground surface. It is estimated that as many as 18,000 tons of material were disposed of in this area. Suspected contaminants include paints, metals, and petroleum hydrocarbons.

#### **STATUS**

A preliminary decision document in 1999 recommended no further action at this site. In 2002, very low concentrations of the pesticide aldrin were detected in groundwater samples collected near Site 18. Aldrin was not detected in subsequent groundwater samples obtained in 2004 and 2005; however, in 2004, the laboratory quantitation limit exceeded the tap water regional screening level.

In 2010, the Navy proposed to monitor two wells associated with Site 18 for the pesticides aldrin and dieldrin as well as VOC, PAH, and TDS for three upcoming semiannual basewide

sampling events (fall 2010, spring 2011 and fall 2011). If aldrin and dieldrin exceed the RSLs, then aldrin and dieldrin will be included as part of the compliance monitoring in the record of decision and remedial design for Site 18.

The Navy is currently completing a focused FS to develop and evaluate potential response actions. The Navy plans to conduct a

geophysical study to identify all potential trench locations and delineate landfill boundaries and to install additional monitoring wells at Site 18 during winter 2011. Following completion of the FS, the Navy will complete a proposed plan and decision document. Future activities include long-term monitoring and maintenance as part of the remedy.

**SITE NUMBER:** 20

**SITE NAME:** Checkerboard Landfill

**REGULATORY PROGRAM:** CERCLA

**RELATED SITES:** UST-R Site 2  
(Building 806 Area)

**DESCRIPTION:**

This former landfill site is located in the southwestern portion of the base. Waste disposal included burial of trash and other rubble from station operations between 1951 and 1965. Approximately 85,000 tons of solid wastes and 1,400 gallons of fuels, waste oil, and hydraulic fluid were buried in trenches during that time. Sludge from the wastewater treatment plant was also buried at the site. Site characterization indicated that contaminants associated with waste disposal are present at very low concentrations in soil but are not migrating from the site via groundwater transport.

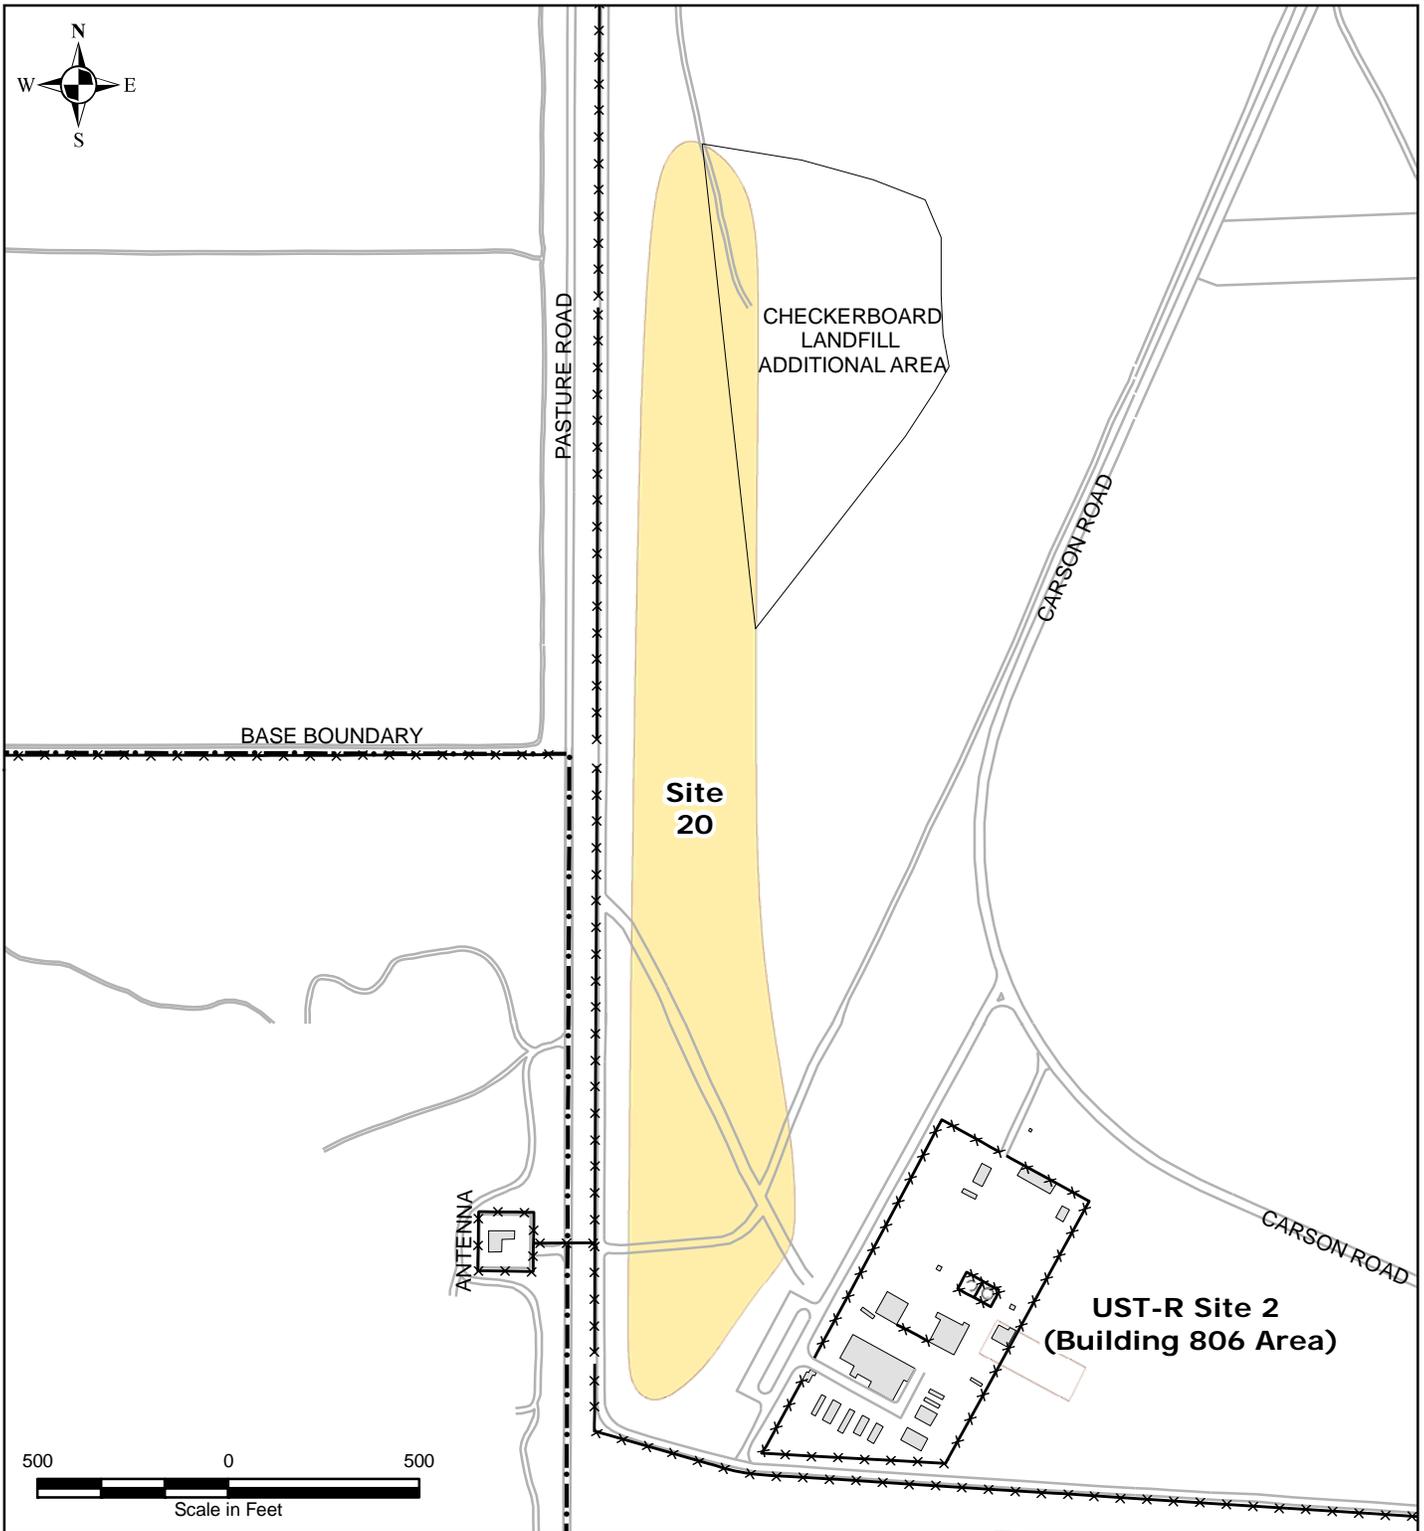

**STATUS:**

A decision document was completed for Site 20 in 2004. Land use controls along with annual groundwater monitoring and landfill maintenance are components of the remedy. The Navy performs maintenance as part of the remedial action that includes: annual groundwater monitoring, inspection of landfill components, and regrading and repair as necessary.

In 2007, the landfill was regraded to mitigate the ponding of surface water. In 2008, the regraded areas were reseeded with native vegetation. Annual groundwater monitoring has been performed since 2007.

The Navy is currently preparing a five-year review report of the landfill to assess whether the remedy is functioning as

intended and is protective of human health and the environment.

- Draft Five-Year Review, Landfill Sites 20, 21, and 22 (Chadux/Tetra Tech 2011)

**SITE NUMBER:** 21

**SITE NAME:** Receiver Site Landfill

**REGULATORY PROGRAM:** CERCLA

**RELATED SITES:** 6, 7, 22, 24 and 28

**DESCRIPTION:**

This former landfill site is located in the east-central portion of the base. The site reportedly received solid and liquid wastes between 1965 and 1975. Solid waste included garbage, trash, and rubble and liquid waste that may have contained JP-5, gasoline, diesel fuel, waste oils, and hydraulic fluids. Solid waste was disposed of at the site only between 1975 and 1980. Approximately 96,000 tons of solid wastes and 1,000 gallons of fuels, waste oil, and hydraulic fluid were buried in trenches or burned during operation. The site characterization identified low levels of petroleum hydrocarbons and TCE in soil and groundwater; however, TCE is not migrating off site.

**STATUS:**

A decision document was completed for Site 21 in 2004. Land use controls along with annual groundwater monitoring and landfill maintenance are components of the remedy. The Navy performs maintenance as part of the remedial action that includes: annual groundwater monitoring, inspection of landfill components, and regrading and repair as necessary.

In 2007, the landfill was regraded to mitigate the ponding of surface water. In 2008, the regraded areas were reseeded with native vegetation. Annual groundwater monitoring has been performed since 2007.

The Navy is currently preparing a five-year review report of the landfill to assess whether the remedy is functioning as intended and is

protective of human health and the environment.

**SITE NUMBER:** 22

**SITE NAME:** Northeast Runway

**REGULATORY PROGRAM:** CERCLA

**RELATED SITES:** 6, 7, 8, 21, 24 and 28

**DESCRIPTION:**

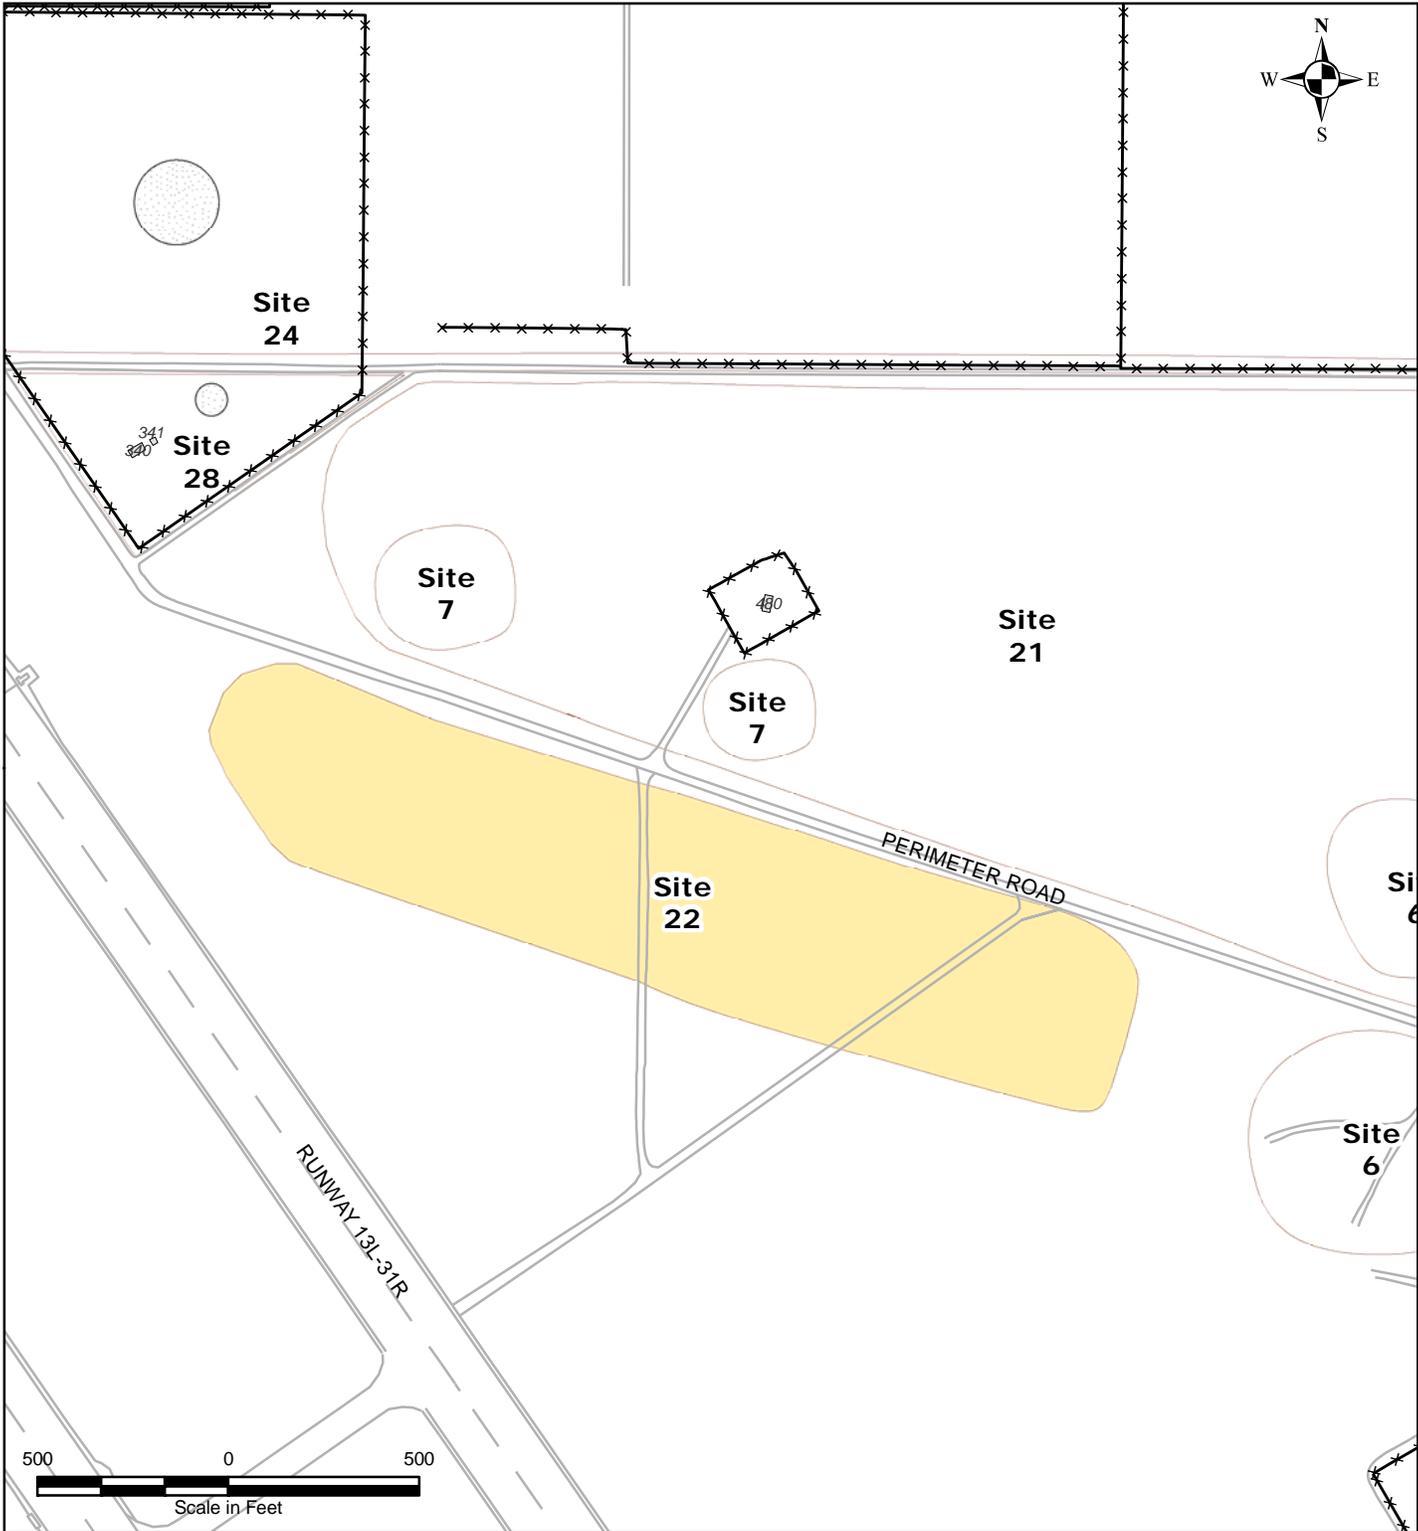

This former landfill site is located just south of Site 21. Landfill disposal was transferred here from Site 21 in 1980 to 1981, and operations continued until 1987. The site reportedly received only solid waste (approximately 60,000 tons of trash) that was buried in trenches during this time. Low levels of petroleum hydrocarbons were identified in soil and groundwater at the site; however, they were attributed to a release from a different site that has since been cleaned up.

**STATUS:**

A decision document was completed for Site 22 in 2004. Land use controls along with annual groundwater monitoring and landfill maintenance are components of the remedy. The Navy performs maintenance as part of the remedial action that includes: annual groundwater monitoring, inspection of landfill components, and regrading and repair as necessary.

In 2007, the landfill was regraded to mitigate the ponding of surface water. In 2008, the regraded areas were reseeded with native vegetation. Annual groundwater monitoring has been performed since 2007.

The Navy is currently preparing a five-year review report of the landfill to assess whether the remedy is functioning as intended and is protective of human health and the environment.

**SITE NUMBER:** 23

**SITE NAME:** Shipping and Receiving Disposal Site

**REGULATORY PROGRAM:** CERCLA

**RELATED SITES:** 10, 11, 16 and 19

#### **DESCRIPTION:**

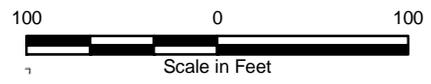

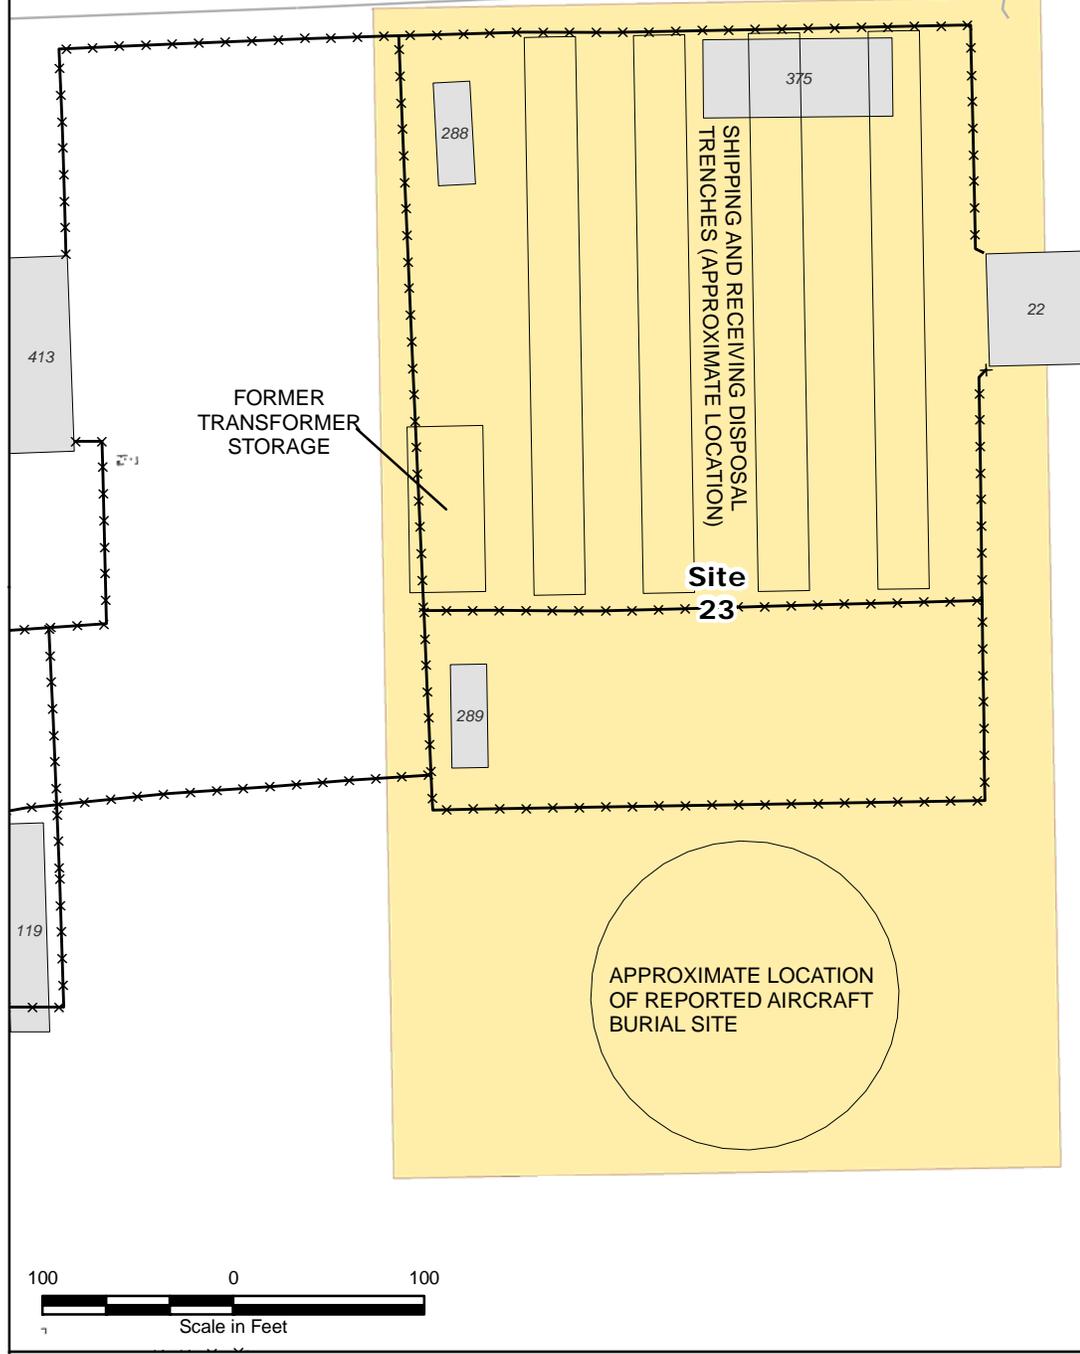

This site is located in the southern portion of the base and reportedly received solid wastes from 1968 to 1984. The wastes included trash and rubble. A burned-out DC-3 fuselage was also reportedly buried in the southern portion of the site. Burn pits were observed at the site in the late 1990s. Asbestos was buried at one location but was later removed and properly disposed of. The site characterization identified petroleum hydrocarbon impacts in groundwater that were attributed to an upgradient source.

#### **STATUS:**

The site was closed with no further action status in November 2003.

**SITE NUMBER:** 28

**SITE NAME:** Northeast Runway Jet Fuel Spill

**REGULATORY PROGRAM:** Petroleum

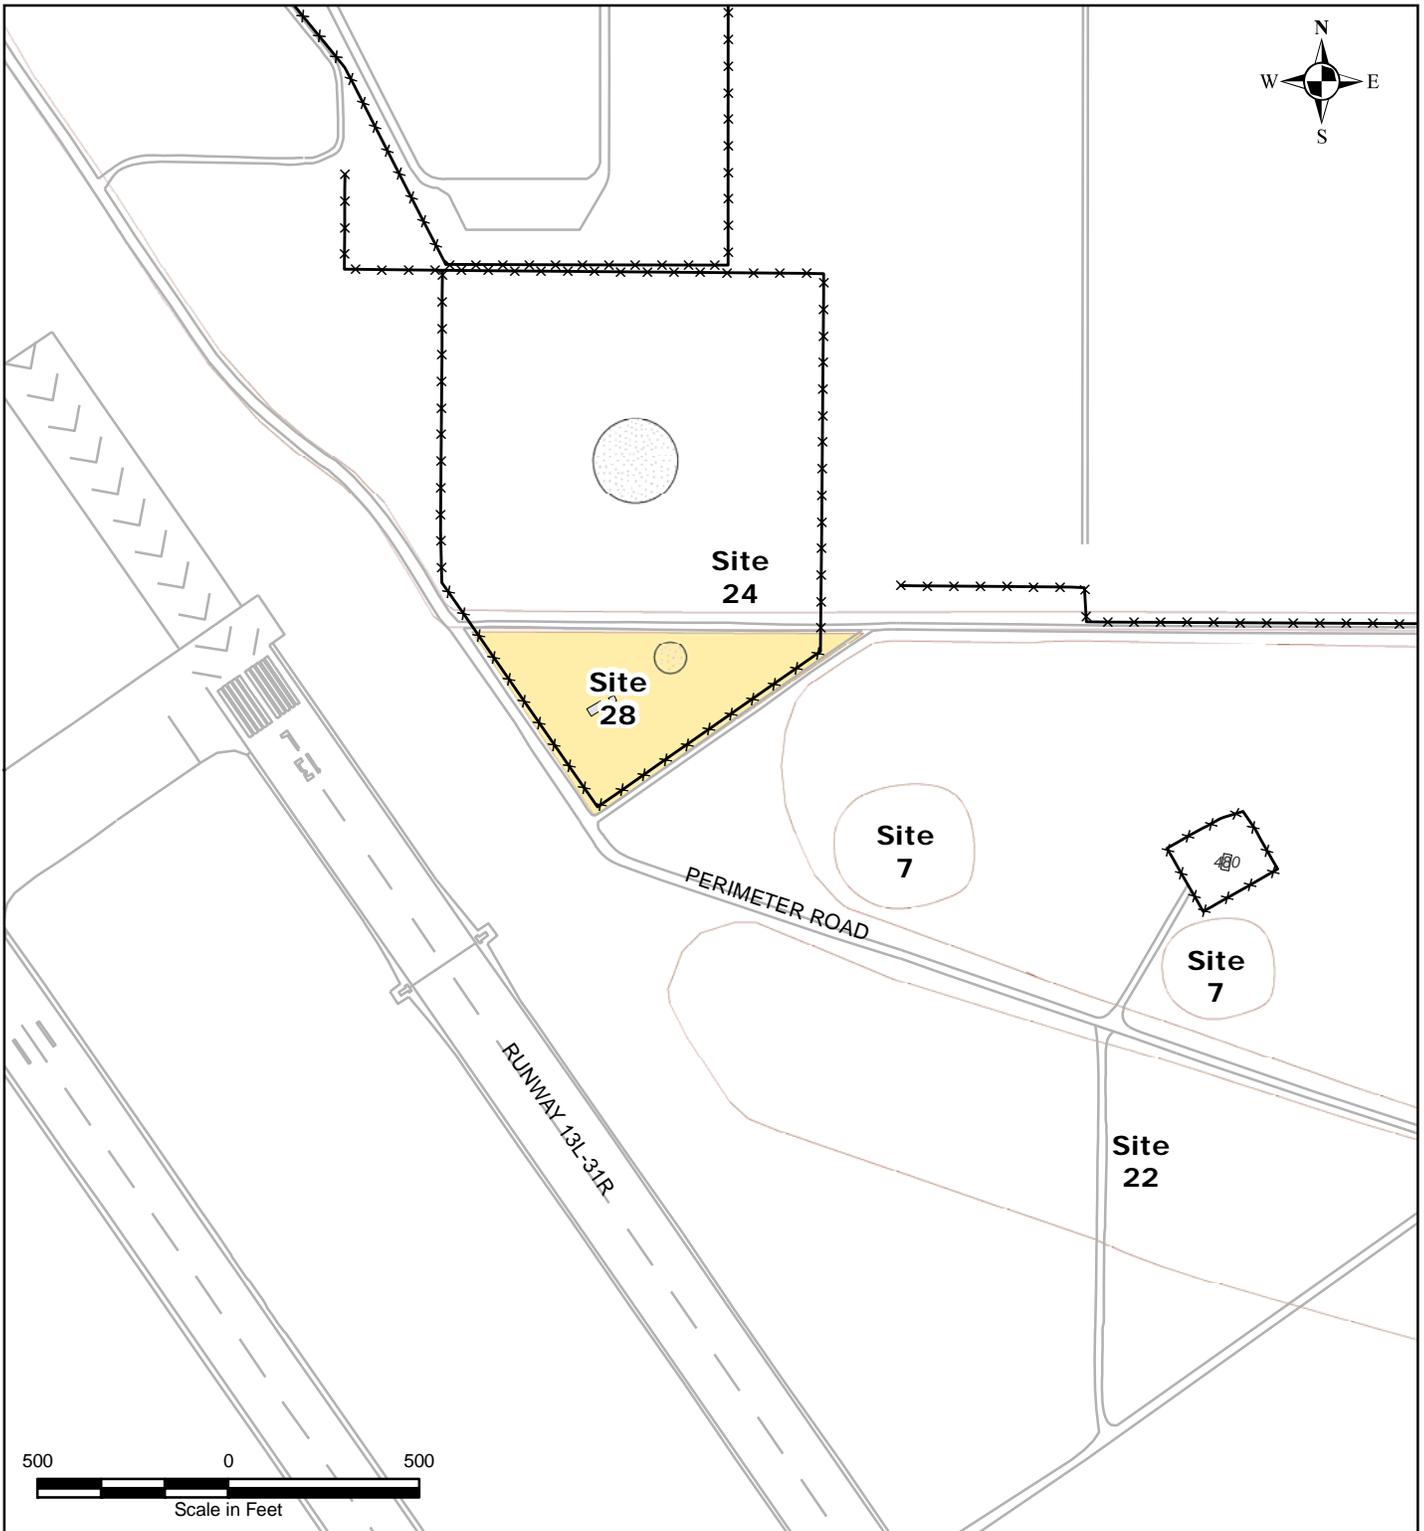

**RELATED SITES** 7, 21, 22 and 24

**DESCRIPTION:**

During semiannual basewide groundwater monitoring of landfill Sites 21 and 22, increasing trends of hydrocarbons have been detected in up-gradient wells. The petroleum contamination is not a result of landfill constituents and there is no infrastructure that could be a source. Based on interviews of base personnel, the likely source was a fuel tank that fell from an aircraft in the late 1990s or early 2000s.

**STATUS:**

Site 28 was recently incorporated into the IRP. The site will require further investigation to delineate the extent of contamination and evaluate remedial alternatives.

**SITE NUMBER:** UST-R Site 1 (Building 395 Area)

**SITE NAME:** NAS Fallon Military Gas Station Area

**REGULATORY PROGRAM:** Petroleum

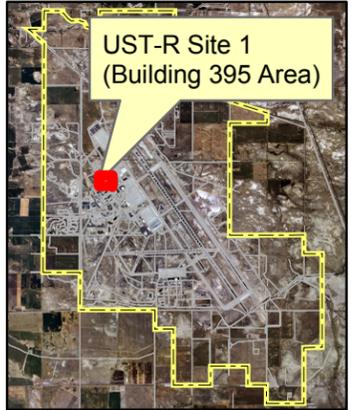

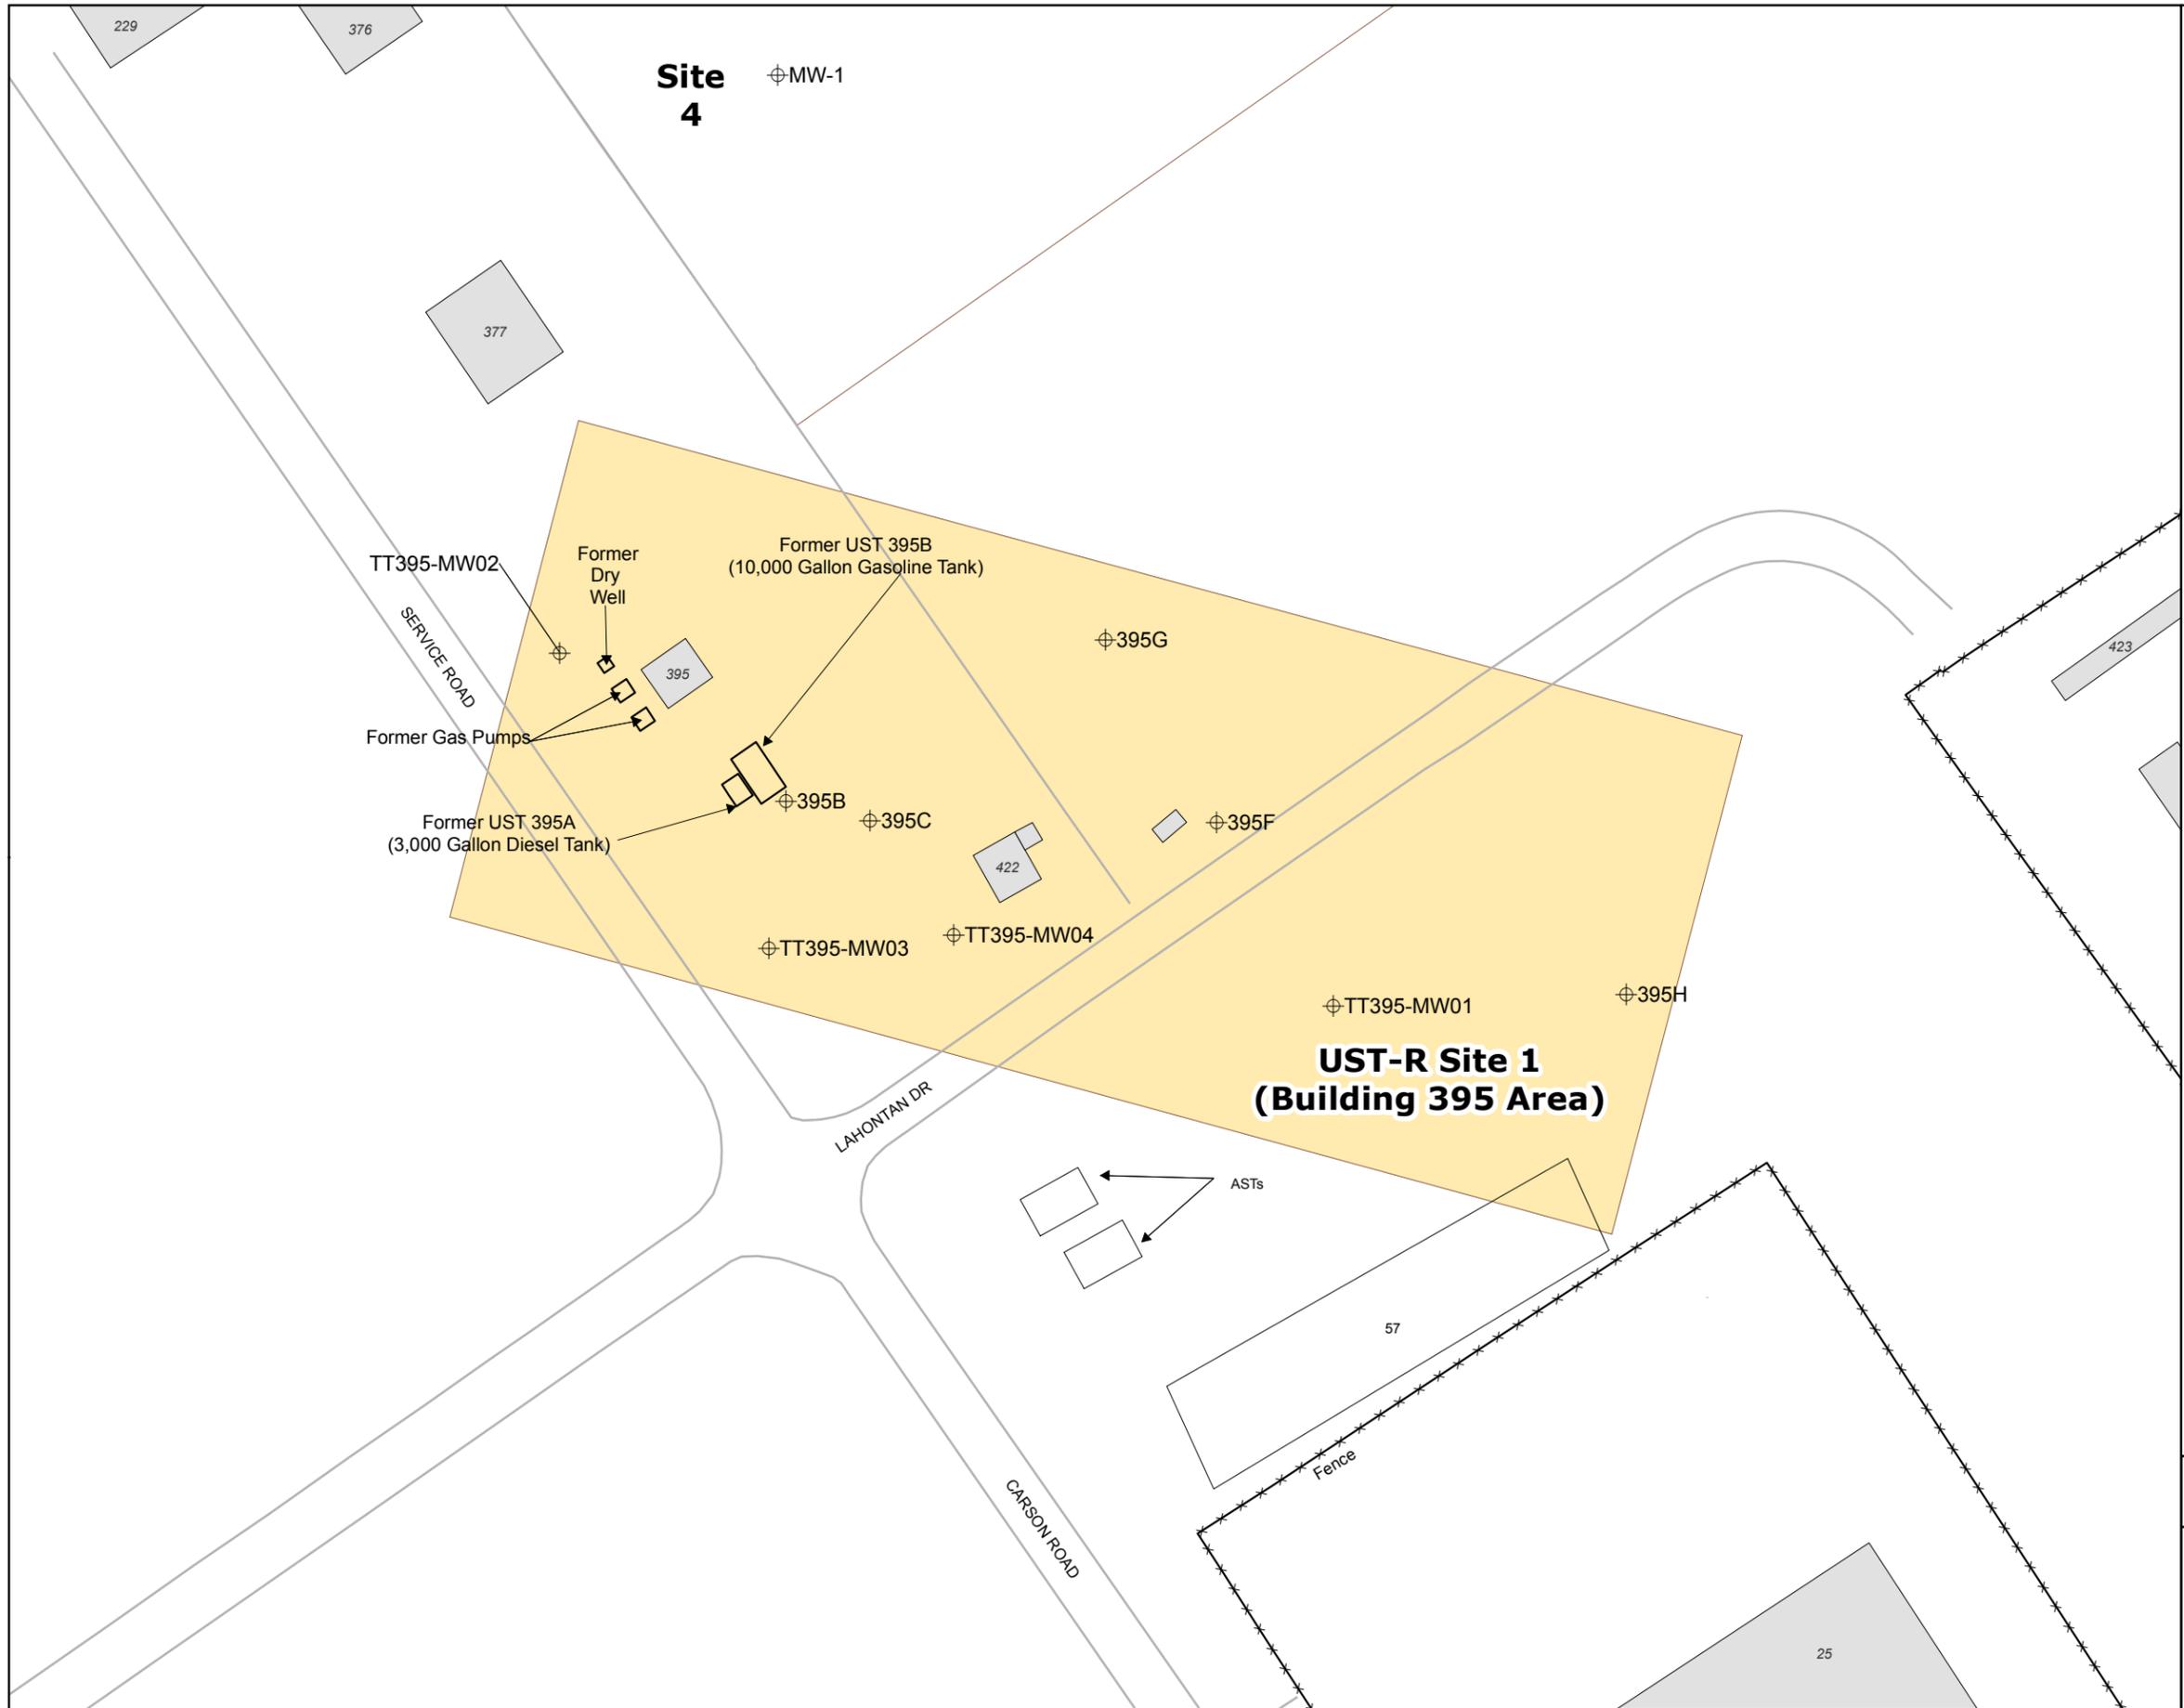

**RELATED SITES:** 2/4 and 3

**DESCRIPTION:**

Site UST-R Site 1 (Building 395 Area) includes the area where USTs 395A and 395B were excavated in 1994. These USTs were located northeast of the Lahontan Drive and Service Road intersection. Free product was observed in the excavation during tank removal. Soil and groundwater samples collected from the excavation contained detectable concentrations of petroleum hydrocarbon compounds and solvents. Nine monitoring wells have been installed to define the contaminant plume.

**STATUS:**

In 2007, a SCAPS investigation delineated the extent of free product and smear zone. The SCAPS data and historical data were used to design an investigation that is currently underway. Soil and groundwater data are being collected to update the risk assessment and identify a strategy for cleanup and site closure.

**REGULATORY PROGRAM:** Petroleum

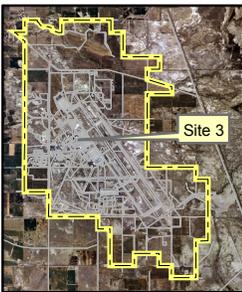

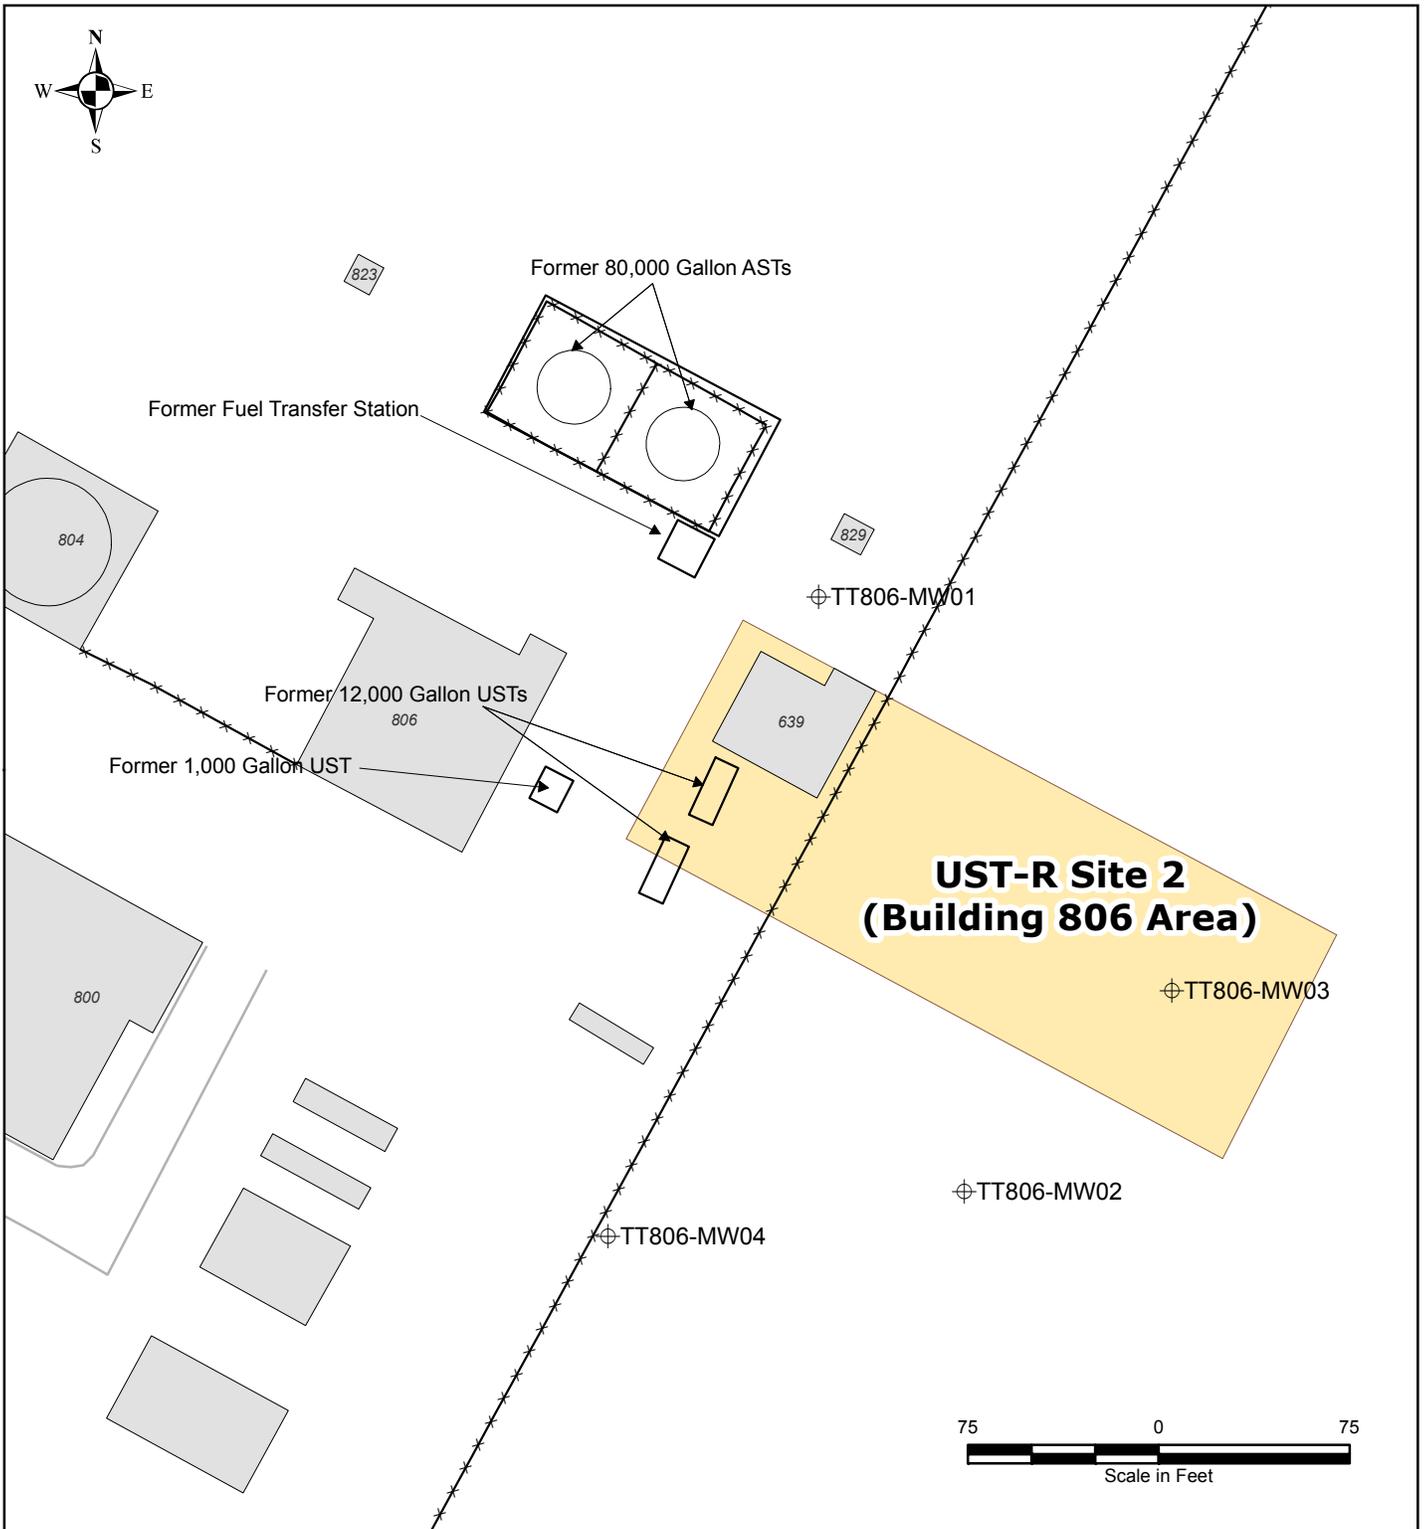

**RELATED SITES:** 20

#### DESCRIPTION:

Site UST-R Site 2 (Building 806 Area) includes the area where USTs 806N and 806S were excavated in 1992. In addition, two 80,000 gallon aboveground storage tanks and a 1,000 gallon UST were removed from the site. The site is located on the southeast side of the Checkerboard facility. The surrounding soil and accumulated groundwater was sampled during tank removal. High levels of TPH-d prompted remedial action at the site. Wells MW-806-A through MW-806-F were installed in the area and were removed in August 2000 after a no further action decision was made.

#### STATUS:

In 2007, a SCAPS investigation indicated elevated concentrations of petroleum product in the soil and smear zone. The SCAPS data and historical data were used to design an investigation that is currently underway. Soil, groundwater, and soil gas data are being collected to update the risk assessment and identify a strategy for cleanup and site closure.

**SITE NUMBER:** UST-R Site 3

**SITE NAME:** Sites R19, 62 and 220 USTs

**REGULATORY PROGRAM:** Petroleum

**RELATED SITES:** 1, 14, 15, 16, UST-R-16 and UST-R-17

**DESCRIPTION:**

UST-R Site 3 was comprised of three former UST locations, R19, 62 and 220 USTs.

UST 220 is located northeast of the intersection of Churchill Avenue and Carson Road. This 1,500-gallon diesel UST was formerly located approximately 7 feet from the southeast corner of Building 220, the Airfield Lighting Standby Generator Building (PRC 1991).

UST R-19 was investigated along with the other Observation Tower Sites (USTs R-16 and R-17) in 1994. UST-R-19 contained two 1,500-gallon diesel USTs and was referred to as, Range B-19 (USTs R19E and R19W). The site is located outside the boundaries of NAS Fallon at Range B-19 approximately 13 miles south of NAS Fallon.

Site 62 is a former service station located on the southern portion of the base. Two 7,760-gallon gasoline USTs (USTs 62 and 62a) were located approximately 21 feet from the southwest corner of Building 62 (PRC 1992a). In June 1994, NDEP concurred that Site 62 should be incorporated into IRP Site 15.

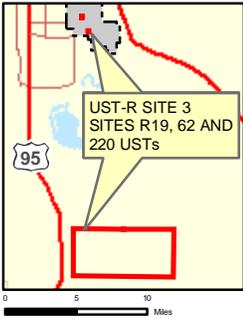

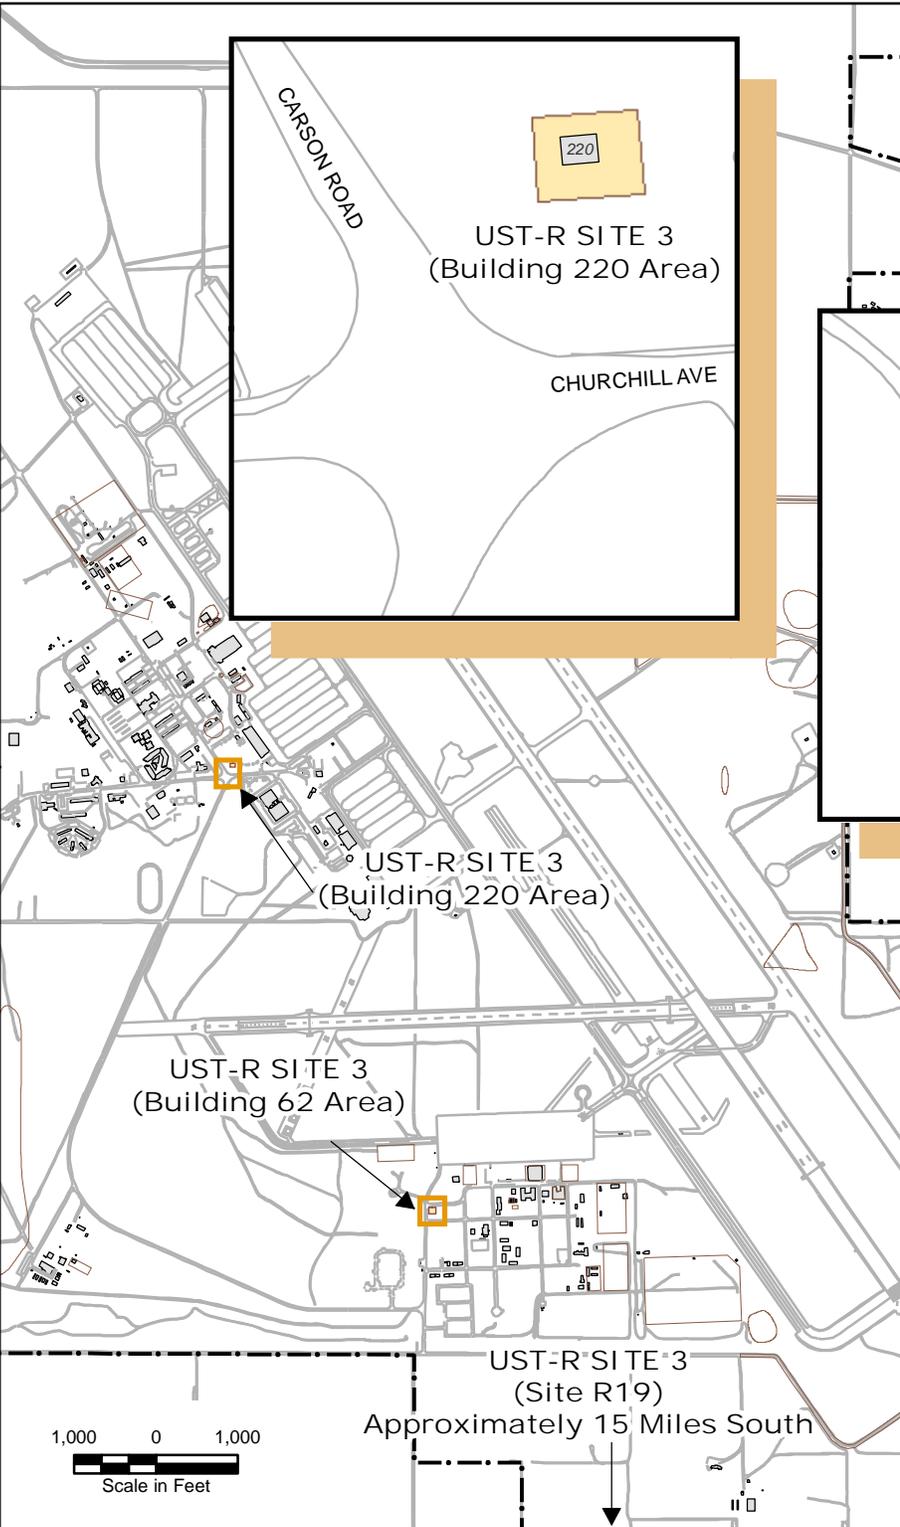

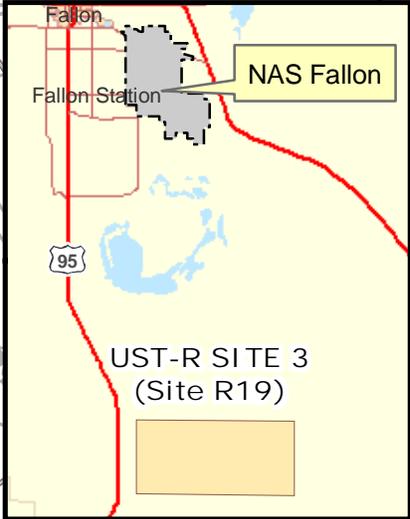

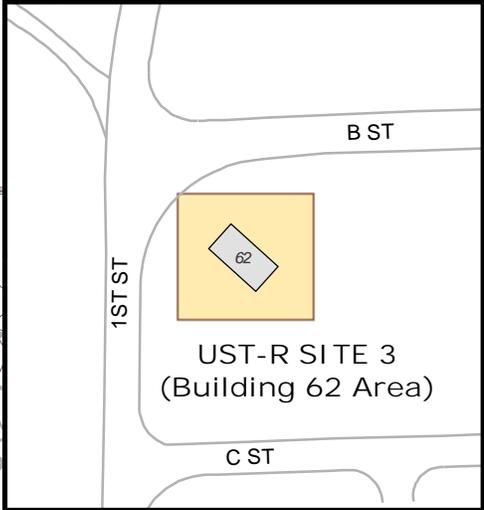

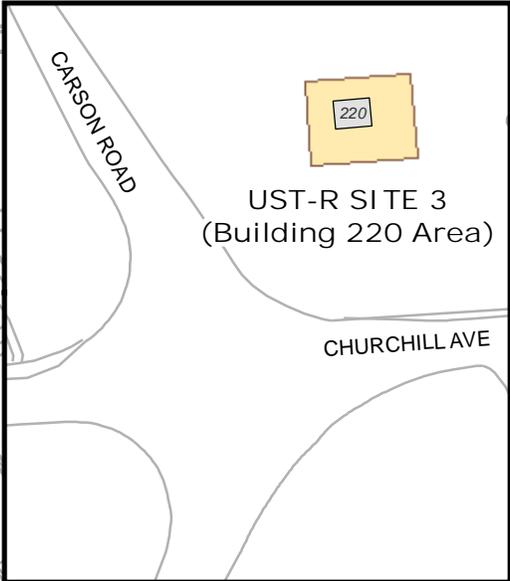

NDEP stated that No Further Action was necessary for R19W in a letter dated June 27, 1994. NDEP later stated in a letter dated

March 13, 1996 that based on the Report of Finding (NAS Fallon Environmental 1995) all significantly contaminated soil encountered at R19E and 220 had been excavated and properly disposed of and no significant groundwater contamination was detected at these sites. Based on this information, NDEP affirmed that no further

investigations or remedial actions would be required at these sites (NDEP 1996).

**STATUS:**

UST 220 and UST R-19 were closed with no further action status in March 1996. UST 62 was incorporated into IRP Site 15 and closed in August 2001.

**SITE NUMBER:** UST-R Site 4 (Building 201 Area)

**SITE NAME:** Building 201 UST Area

**REGULATORY PROGRAM:** Petroleum

**RELATED SITES:** 1, 2/4 and 3

**DESCRIPTION:**

Building 201 was built in 1955 as the Fuel Farm Operations Building. Originally the building was heated using an oil fired steam boiler. Fuel was supplied from a 750-gallon UST approximately 5 feet from the west wall of the building. The tank and associated lines were abandoned in place in approximately 1959 when the building was connected to the Central Heating Plant (B-333). During a review of utility drawings in 2008, the Environmental Division was notified that there was a possibility of a UST at building 201. It is suspected that residual fuel has leaked into the soil as the tank deteriorated.

Approximately 3 cubic yards (3.66 tons) of impacted soil was excavated. Samples were taken to confirm contamination. Results showed significant TPH contamination.

**STATUS:**

UST-R Site 4 was recently incorporated into the IRP. The site will require further investigation to delineate the extent of contamination and evaluate remedial alternatives

**SITE NUMBER:** UST-R Site 5  
**SITE NAME:** Building 314 Area

**REGULATORY PROGRAM:** Petroleum

**RELATED SITES** 2/4 and 3

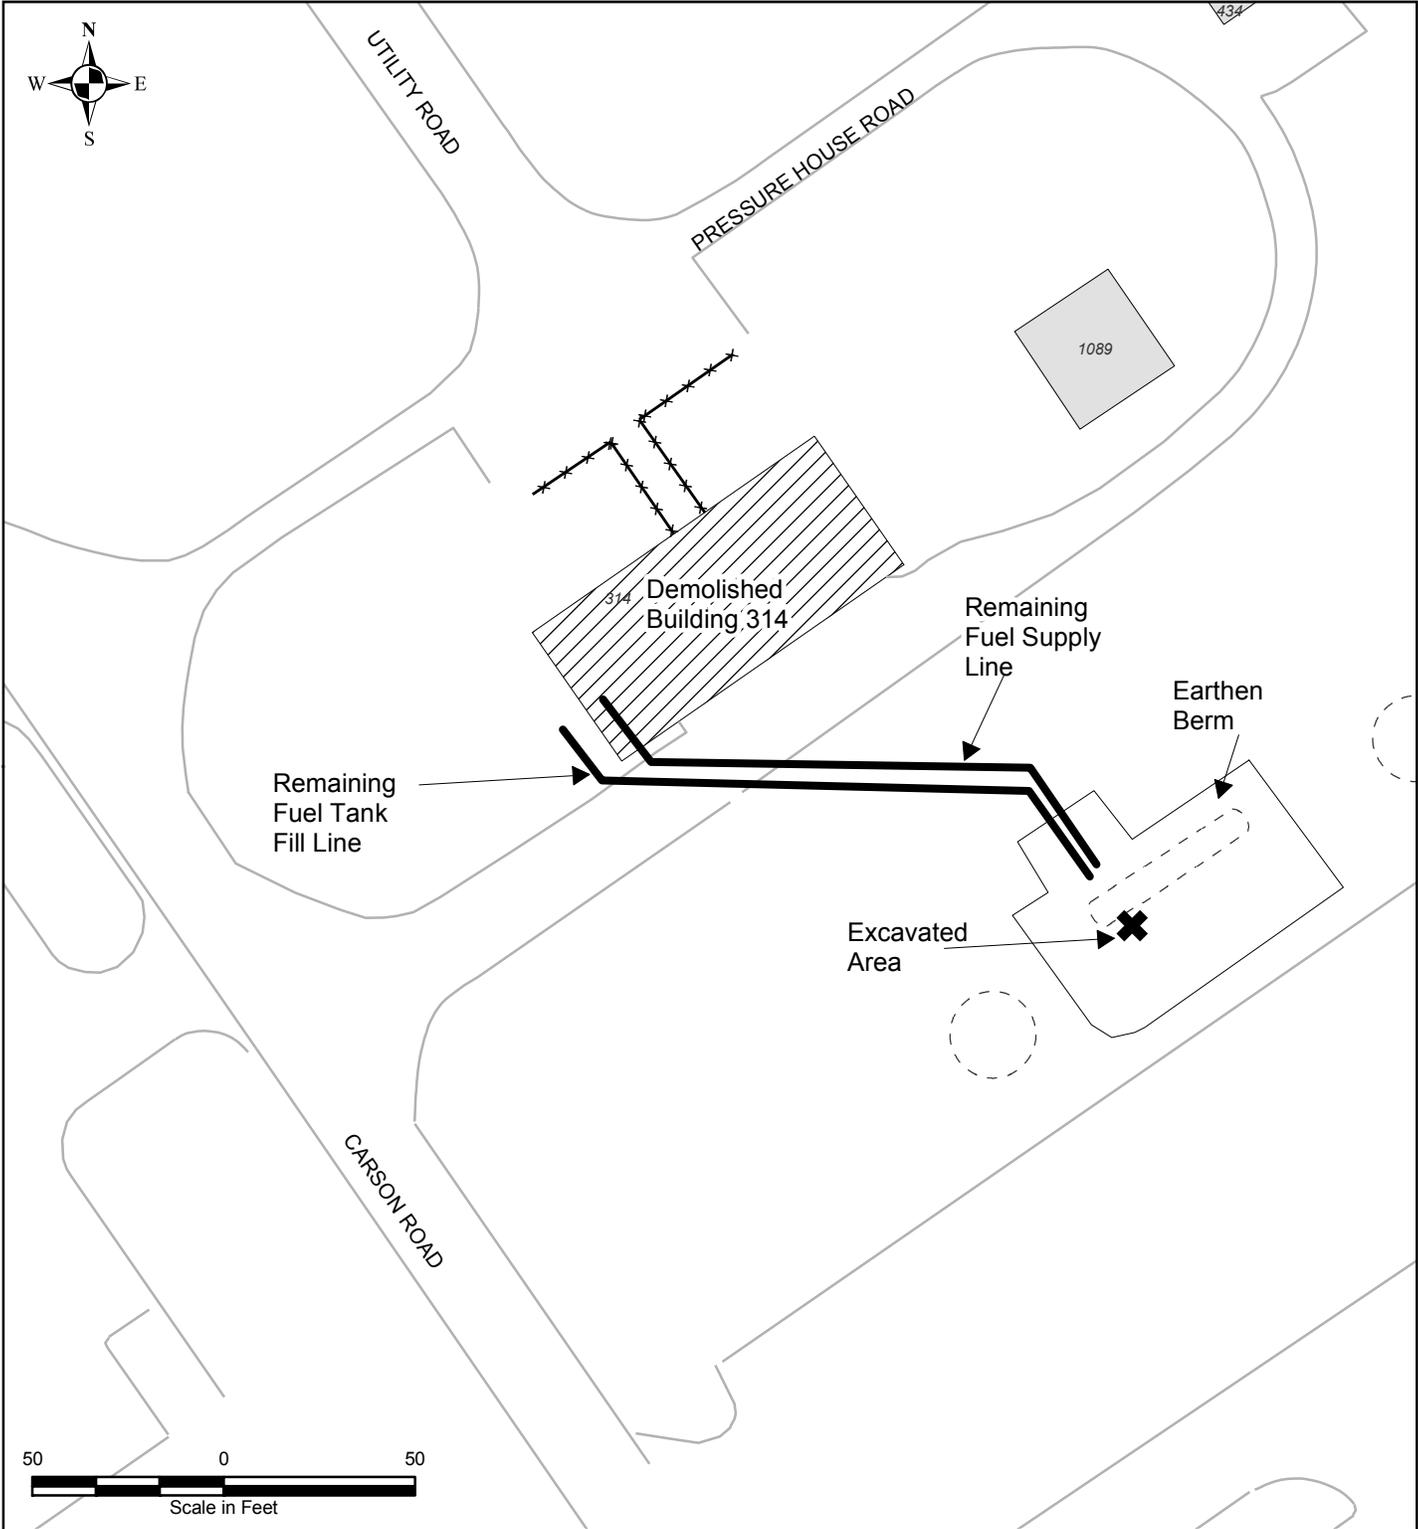

**DESCRIPTION:**

Building 314 (demolished in March 2008) was a central heating plant built in 1957 that provided high temperature hot water to several buildings on the north side of the station. The boilers initially burned #6 fuel oil stored in a 60,000 gallon above ground storage tank south of the building and may have later stored diesel fuel. On 19 March 2008, the NAS Fallon Environmental Division was notified that the contractor demolishing B-314 had encountered contaminated soil while capping off fuel lines.

**STATUS:**

Five confirmation samples were taken from each wall and the bottom of the excavation. Between March and October 2008 approximately 30 tons of impacted soils were removed and treated by Nevada Thermal Services. All associated piping was removed in 2010 by the NAS Fallon Public Works Center,

UST-R Site 5 was recently incorporated into the IRP. The site will require further investigation to delineate the extent of contamination and evaluate remedial alternatives.

SUBJECT: MOVING INSTALLATION RESTORATION PROGRAM SITE 6 INTO  
THE PETROLEUM PROGRAM AT NAVAL AIR STATION FALLON,  
FALLON, NEVADA

Dear Mr. Smale:

As part of recent extensive environmental investigations at Naval Air Station (NAS) Fallon, the Navy has completed soil and groundwater sampling at Installation Restoration Program Site 6. Site 6, also known as the defuel disposal area, is located near the eastern boundary of NAS Fallon, midway between the base's north and south boundaries (see Figure 1). Site 6 consists of two areas approximately 500 feet by 500 feet where off-specification fuel was disposed of on the ground surface between 1966 and 1972. The northern area, which is slightly smaller, is located under the soil cover of the closed landfill at Site 21, and the southern area is located just south of the northern area across Perimeter Road (see Figure 2).

The Navy has conducted investigations at Site 6 using the Comprehensive Environmental Response Compensation and Liability Act (CERCLA), its implementing regulations promulgated in the National Oil and Hazardous Substances Pollution Contingency Plan (NCP), and its guidance as the response action authority. These past investigations, including a CERCLA remedial investigation (RI), have found fuel-related contamination in soil and groundwater (Oak Ridge National Laboratory [ORNL] 1994). In 2006, as part of the planning for the RI addendum, petroleum free product was detected in the southern portion of Site 6 (SulTech 2007). In 2007 and 2008, additional soil and groundwater sampling indicated the presence of total petroleum hydrocarbons (TPH) as gasoline and diesel range organics, polycyclic aromatic hydrocarbons (PAH), and volatile organic compounds (VOC) all related to the disposal of fuel at the Site.

5090  
Ser JE30.MQ/0408  
February 8, 2011

There were a few detections of acetone in soil samples, a non-fuel related VOC. However, acetone is a common laboratory contaminant and is not believed to be related to the Navy's operations at Site 6. Attachment 1 presents a summary of the free product, soil, and groundwater investigations conducted from 2006 through 2008 at Site 6.

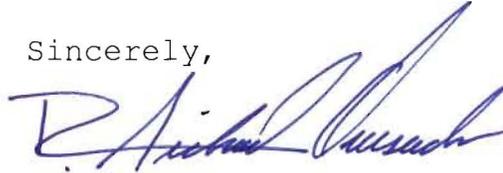

Based on the results of these investigations, the Navy has concluded that the releases at Site 6 fall within the petroleum exclusion of CERCLA, and therefore, cannot be further addressed using CERCLA. CERCLA Section 101(14) defines a CERCLA hazardous substance, but excludes petroleum from its definition (commonly referred to as the petroleum exclusion). The CERCLA petroleum exclusion includes crude oil and any fraction thereof that is not otherwise specifically listed or designated as a hazardous substance. CERCLA response authority cannot be used to address a release that consists of petroleum because petroleum is not a CERCLA hazardous substance.

The free product, TPH, PAH, and VOC detected at Site 6 are associated with disposal of off-specification fuel. The fuel was refined but was not suitable for use at the base, and so was disposed of on the ground at Site 6. The specific constituents detected in Site 6 soil and groundwater, the PAHs and VOCs, are indigenous to petroleum or associated with the petroleum refining process. Therefore, the Navy is unable to address the releases at Site 6 using CERCLA. Instead, the Navy will address the releases under its petroleum program using the State of Nevada's Bureau of Corrective Action regulations. The Navy will include the results of the investigations completed at Site 6 from 2006 through 2008 in a petroleum sites data report and associated corrective action plan report that describes the nature and extent of the fuel-related releases, assesses risks to human health and the environment, and evaluates corrective action alternatives to address the risks.

## **Enclosure 1**

Summary of Investigations Completed at Site 6  
2006 through 2008  
Naval Air Station Fallon

The following sections describe the results of the investigations into soil, free product, and groundwater releases completed at Site 6 from 2006 to 2008. This information, along with sampling results, risk assessments, and corrective action evaluations, will be included in a petroleum sites data report and associated corrective action plan.

## **Site 6 Soil Investigation**

A total of 18 soil borings were installed at Site 6 (see Figure A-1). Borings TT06-SB01 through TT02-SB12 were installed in December 2007 and targeted the area where free product had been measured in the past, as well as during the planning phase for the RI as recently as 2006. Based on the sample results from these borings an additional six borings were installed in October 2008, TT06-SB13 through TT06-SB18. All soil samples at Site 6 were analyzed for volatile organic compounds (VOC), total petroleum hydrocarbon-purgeable (TPH-p), total petroleum hydrocarbons-extractable (TPH-e), and polycyclic aromatic hydrocarbons (PAH).

The analytical results from soil samples at Site 6 indicate detections of TPH, PAH, and VOCs. TPH detections occurred mostly within the extent of free product footprint at soil borings TT06-SB02, TT06-SB03, TT06-SB04, and TT06-SB05, with an additional detection up-gradient at TT06-SB16. Samples from these soil borings range from 140 to 3,600 milligrams per kilogram (mg/kg) for jet propellant 5 (JP5) range organics between 4 and 6.5 feet below ground surface (bgs) and between 1 and 2 feet bgs at TT06-SB02. Boring TT06-SB03 also contained gasoline range organic (GRO) concentrations and soil boring TT06-SB11 at the southern edge of Site 6 contained diesel range organics (DRO). TPH detections to the south of Site 6 showed up in soil borings TT06-SB11 and TT06-SB17. Other borings that contain minor detections of TPH down gradient are TT06-SB04 and TT06-SB09. A number of VOC compounds related to fuel were detected at the site and one compound not related directly to a fuel (acetone) was detected in seven of the samples. Acetone is a common laboratory contaminant and is not believed to be related to Navy activities at Site 6. It was detected ranging from 0.062 to 0.770 mg/kg.

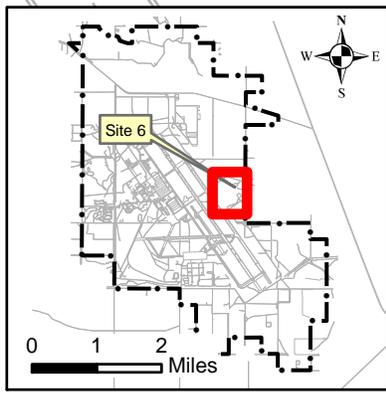

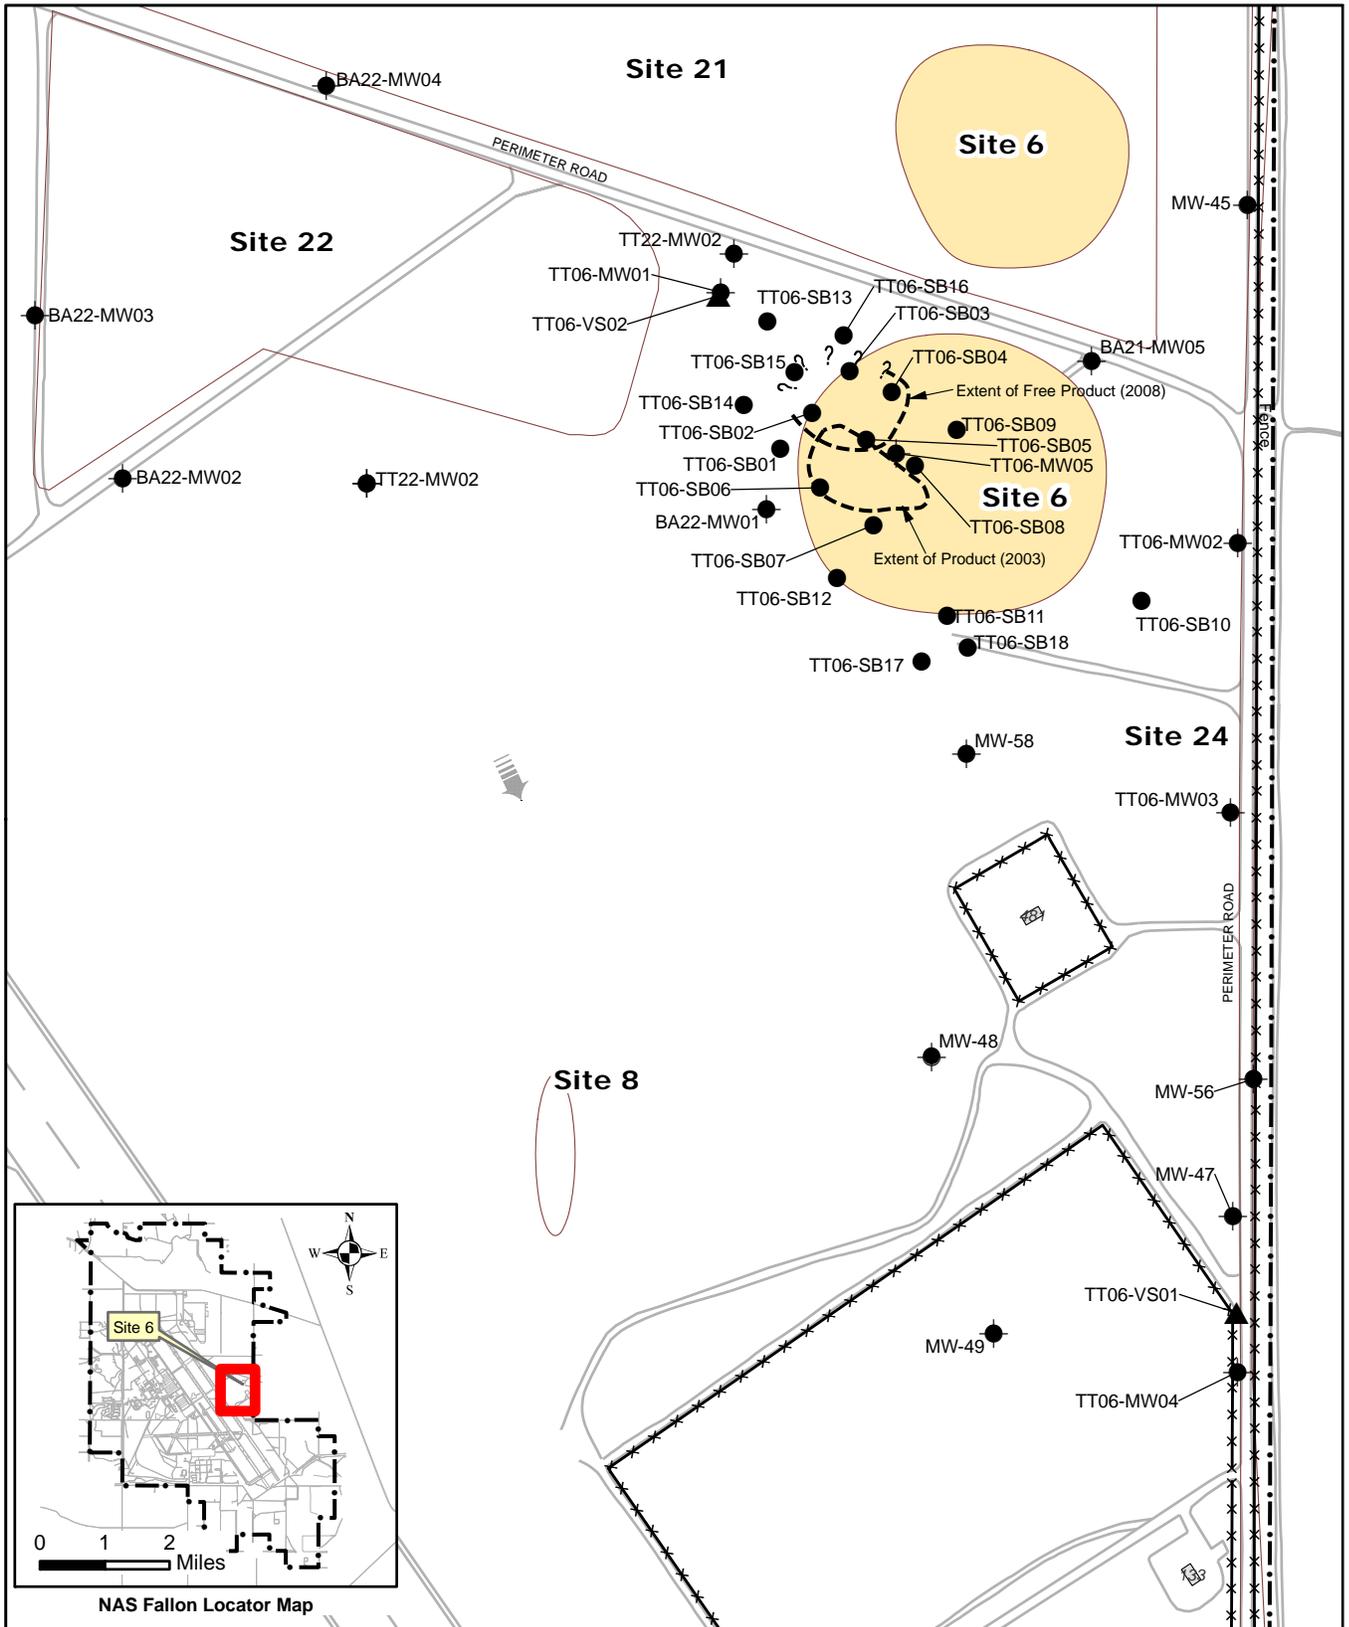

## **Site 6 Free Product and Groundwater Investigation**

Free product was first detected in the central portion of the southern disposal area during the initial RI in 1994, and was again delineated in a trend analysis report from 2003 (see Figure A-1). As part of the planning for the RI addendum in 2006, free product was measured repeatedly in one site well from 0.05 to 0.94 feet in thickness. The results of the sampling and measurements collected during the RI in 2007 and 2008 showed a slightly larger boundary of floating product in the central portion of the southern disposal area as well as farther upgradient than was depicted in 2003.

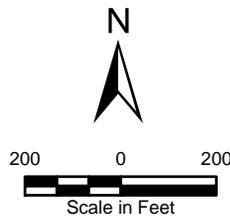

Five new monitoring wells were installed as part of the additional investigation at Site 6 (see Figure A-1). In addition to the five new wells, samples were also collected from five existing wells at the site. Groundwater samples were analyzed for semi-volatile organic compounds (SVOC), VOCs, total dissolved solids (TDS), TPH-p, TPH-e, and PAHs in 2007 and a selected few wells were sampled again in 2008. The results from groundwater sampling at Site 6 indicate detections of TPH, VOCs, and PAHs. 1-methylnaphthalene and 2-methylnaphthalene were the most common PAHs detected and can be found across the site.

TPH was detected in the form of DRO, GRO, and motor oil range organics (MRO). DRO is the most common and occurs in the highest concentration (4,600 µg/L) at TT06-MW05, located in the center of Site 6.

VOCs were detected at four wells at Site 6, with the majority of detections appearing at TT06-MW05. Isopropylbenzene, n-butylbenzene and sec-butylbenzene are the most common occurring VOCs with three detections each. TDS concentrations for Site 6 range from 15,000 to 60,000 milligrams per liter (mg/L)

**re: NDEP concurrence on moving Installation Restoration Program Site 6 into the petroleum program at Naval Air Station Fallon**

Dear Mr. Quesada:

The Nevada Division of Environmental Protection (NDEP) has received a letter request dated February 8, 2011 to move Installation Restoration Program Site 6 into the petroleum program at the Naval Air Station Fallon. Site 6 includes two areas at NAS Fallon where off-specification fuel was disposed of on the ground surface between 1966 and 1972. The request to change the environmental oversight authorities from the federal Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) to the State of Nevada's corrective action authorities reflects the "petroleum exclusion" that is present in CERCLA. Since Site 6 received contamination from refined petroleum products and recent assessment confirms that contamination at the site is limited to constituents associated with refined petroleum products, the NDEP concurs that the inclusion of the site into the petroleum program is appropriate.

The NDEP concurs with the letter request and recommends transfer of Site 6 into the petroleum program. We believe that this move will expedite the cleanup process at Site 6 while still maintaining an equivalent protection of human health and the environment. The NDEP will continue to provide oversight consistent with State environmental authorities. If you have any questions, please do not hesitate to contact me by phone at (775) 687-9384 or by e-mail at [ssmale@ndep.nv.gov](mailto:ssmale@ndep.nv.gov).

Sincerely,

Scott Smale  
Bureau of Corrective Actions
