Notes:			
<p>(1) The emission factors listed for controlled emissions require wet dust suppression located at each emission unit and transfer point. Wet dust suppression consists of water sprays, fogging water sprays, fogging water sprays with chemical surfactant, or pneumatic fogging water sprays. Pre-wetting of material does not constitute wet dust suppression.</p> <p>(2) The emission factors listed for controlled emissions require the use of an enclosure at the transfer point. An enclosure must have a solid cover surrounding the transfer point. This excludes entries and exits. Transfer points must not be clearly visible.</p>

Footnotes: (1) The Emission Factors as stated in this application must be used. (2) The total of PM ₁₀ and PM _{2.5} emissions combined for all units must not exceed the limits established for the minimum setback and hours of operation that are being requested. (3) Engine PM/PM ₁₀ /PM _{2.5} lb/day emissions will always be 15.62 lb/day each. This is to show that engine emissions were accounted for. These engine contributions are considered part of the background and do not need to be considered when comparing to the limit established for the minimum setback and hours of operation that are being requested. (4) Use additional forms as necessary.

SURFACE AREA DISTURBANCE FORM

1. Project Name: [Click or tap here to enter text.](#)
2. Total Acres Disturbed: [Click or tap here to enter text.](#)
3. NAC 445B.22037 requires fugitive dust to be controlled (regardless of the size or amount of acreage disturbed), and requires an ongoing program, using best practical methods, to prevent particulate matter from becoming airborne. All activities which have the potential to adversely affect the local air quality must implement all appropriate measures to limit controllable emissions. Appropriate measures for dust control may consist of a phased approach to acreage disturbance rather than disturbing the entire area all at once; using wet suppression through such application methods as water trucks or water spray systems to control wind-blown dust; the application of soil binding agents or chemical surfactant to roadways and areas of disturbed soil; as well as the use of wind-break or wind limiting fencing designed to limit wind erosion soils.
4. Please check each box that applies for Best Management Practices (BMPs) used for controlling dust on project's disturbed areas:

- Water trucks
- Graveling/paving of roadway storage areas and staging areas
- Dust palliatives
- Posting and limiting vehicle speeds
- Ceasing operations during high wind events
- Fencing or berming to prevent unauthorized access to disturbed areas
- Application of water sprays on material storage piles on a regular basis
- Covering material storage piles with tarpaulin or geo-textiles; tenting
- Use of overhead water spray racks or water hoses
- Track-out controls (graveled entranced, exit area, and street sweeping)
- Landscape preservation and impact avoidance
- Wind fence
- Pre-watering of areas to be disturbed (including all unpaved onsite roads and staging areas)
- Inform all subcontractors (including truck drivers) of their responsibilities for the control of fugitive dust while they are on the project site
- Training of equipment operators to recognize fugitive dust generation and having the authority to shut down operations until water truck arrives and sprays water on the disturbed areas
