2004 Nutrient Levels in Carson Valley Groundwater based upon Discharge Monitoring Reports

Introduction

In support of our Clean Water Act responsibilities, the Nevada Division of Environmental Protection (NDEP) – Bureau of Water Quality Planning (BWQP) is developing a Carson River Watershed Assessment or Report Card. Drawing upon numerous studies and monitoring efforts, the Report Card will provide a compilation of current knowledge about the chemical, physical and biological health of the Carson River watershed with a focus on aquatic life uses from the Nevada/California stateline to Lahontan Reservoir. It is hoped that the Report Card will be a valuable tool for educating the public, agencies and decisionmakers on the state of the river (from a Clean Water Act perspective), thereby providing direction for their future actions and decisions. The Report Card will also be a key planning tool for BWQP in possible future steps, such as standards revisions, comprehensive Total Maximum Daily Loads (TMDLs), watershed plan development and restoration projects.

The purpose of this report is to summarize nutrient data that are submitted to NDEP as part of groundwater permit conditions. It is not the intent of this report to identify sources and their contribution, but only to present a compilation of NDEP groundwater quality data to compliment other works.

BWQP and others have been interested in the nutrients in the groundwater for a number of reasons:

- Studies have found that the Carson River is often nitrogen-limited with additional nitrogen loading potentially leading to more algae growth and possible dissolved oxygen problems (Warwick et al., 1997; Latham, 2005). A better understanding of possible nitrogen loading to the Carson River from the regional groundwater is important when assessing nutrients and their impacts to the river.
- Beginning in 2003, the Desert Research Institute started developing a nutrient & dissolved oxygen model for the Carson River from Genoa Lane to Deer Run Road (in Carson City). One of the necessary model inputs include groundwater quantity and quality, however limited groundwater quality data have been published. It was hoped that data taken from NDEP files would be useful in better characterizing the groundwater quality for modeling purposes.
- Rosen (2003) examined USGS well data and found the existence of elevated (above natural background) nitrate levels in portions of the Carson Valley. BWQP was curious how groundwater quality data from NDEP files would characterize other parts of the groundwater system.
- Alvarez and Seiler (2004) found large increases in orthophosphate loads in Carson Valley during the summer and they state that the source is likely agricultural. In response to the

USGS study, BWQP is seeking to improve quantification of phosphorus in the Carson Valley groundwater.

Background

NDEP issues a variety of discharge permits, one of which is referred to as a groundwater permit. Groundwater permits are issued to any size treatment facility that discharges to the groundwater through infiltration basins, land application of effluent or leach fields (NDEP, 2004). Groundwater permits in Carson Valley typically limit nitrate levels in the receiving groundwater to 10 mg/l¹, equal to the maximum contaminant level (MCL) for drinking water. However, these permits also include additional limitations, similar to the following:

- If the nitrate levels increase to 7, the permittee shall notify NDEP and submit a plan for the increased reduction of nitrogen in the discharge to the groundwater.
- If levels increase to 9, the permittee shall begin implementation of the nitrogen reduction plan.
- If the nitrate level increases to 10, the permittee shall discontinue the discharge to the environment.

Additionally, the effluent reuse permits place restrictions on the pounds/acre of nitrogen that can be applied to the irrigated lands. In general, the total nitrogen applied (from effluent and fertilizer) is not to be greater than the total nitrogen uptake (by crops and loss from denitrification and volatilization).

None of the permits reviewed for this report contained any limitations for phosphorus levels in the groundwater. This is due, in part, to the fact that no Safe Drinking Water Act MCL has been set for phosphorus in groundwater.

As part of the permit conditions, groundwater discharge permittees are required to install and routinely sample groundwater monitoring wells. The sampling frequency, the sample type, the parameters to be monitored, the parameter limitations, the analytical methods, and the reporting frequency are determined by the Division; and can vary from permit to permit. Results of the groundwater monitoring are submitted to NDEP as part of Discharge Monitoring Reports (DMRs). Selected groundwater quality data (nitrate, total nitrogen, phosphorus [when available]²) from the DMRs were used to develop this report.

¹ The nitrate water quality standard (beneficial use standard) for the Carson River is also 10 mg/l (Nevada Administrative Code [NAC] 445A.146 through 445A.158) and appears to have been set to protect the drinking water beneficial use. However, this level is much too large for the control of eutrophication and protection of aquatic life. Additionally, the NAC contains total nitrogen (TN) RMHQs (Requirements to Maintain Existing Higher Quality) for the various control points along the Carson River system. These TN RMHQs range from 0.4 to 1.3 mg/l for annual averages and from 0.5 to 1.7 mg/l for single values. The Bureau of Water Quality Planning is considering the development of nitrate RMHQs in order to focus on the bioavailable components of TN that lead to eutrophication. Additionally, the Bureau of Water Quality Planning is investigating alternative nutrient criteria (beneficial use criteria) which recognizes the role of both phosphorus and nitrogen in algal growth.

² Phosphorus data are available only for a few of the monitoring locations.

Results

Table 1 summarizes the active groundwater permits that were considered for this report. For each of these permits, monitoring well location information and associated water quality data were compiled from NDEP Bureau of Water Pollution Control files. The wells included in this analysis are summarized in Table 2 with locations on Figure 1.

The water quality data compiled from the DMRs for each monitoring site are summarized in Appendices A and B. These appendices represent a significant amount of data and to simplify the presentation of these data, each of the wells was placed into one of 10 groups based upon geographic locations. The minimum, median and maximum nutrient concentrations within each group are summarized in Table 3. Data from wells with known construction problems were not used in developing these statistics. As shown in Table 3 and in the appendices, not all monitoring wells have associated phosphorus data.

The data presented in this report provide additional information on the overall nutrient levels in areas of the Carson Valley groundwater system. However, it is not known the extent to which the nutrients maybe migrating to and entering the Carson River. Extensive investigations would be needed to characterize the groundwater quality/quantity entering the river.

While the data presented in this report are associated with groundwater permit activities, one should not infer that these activities are the source of the nutrients in the groundwater. Additional investigations are needed to determine contributions to the groundwater from all potential sources, such as historic and current agricultural activities (which could include irrigation with surface water, groundwater, and treated effluent; and grazing, etc.), septic tank effluent, possible geothermal inputs and other potential natural sources.

Table 1. Active NEV Permits with Groundwater Quality Monitoring in Carson Valley

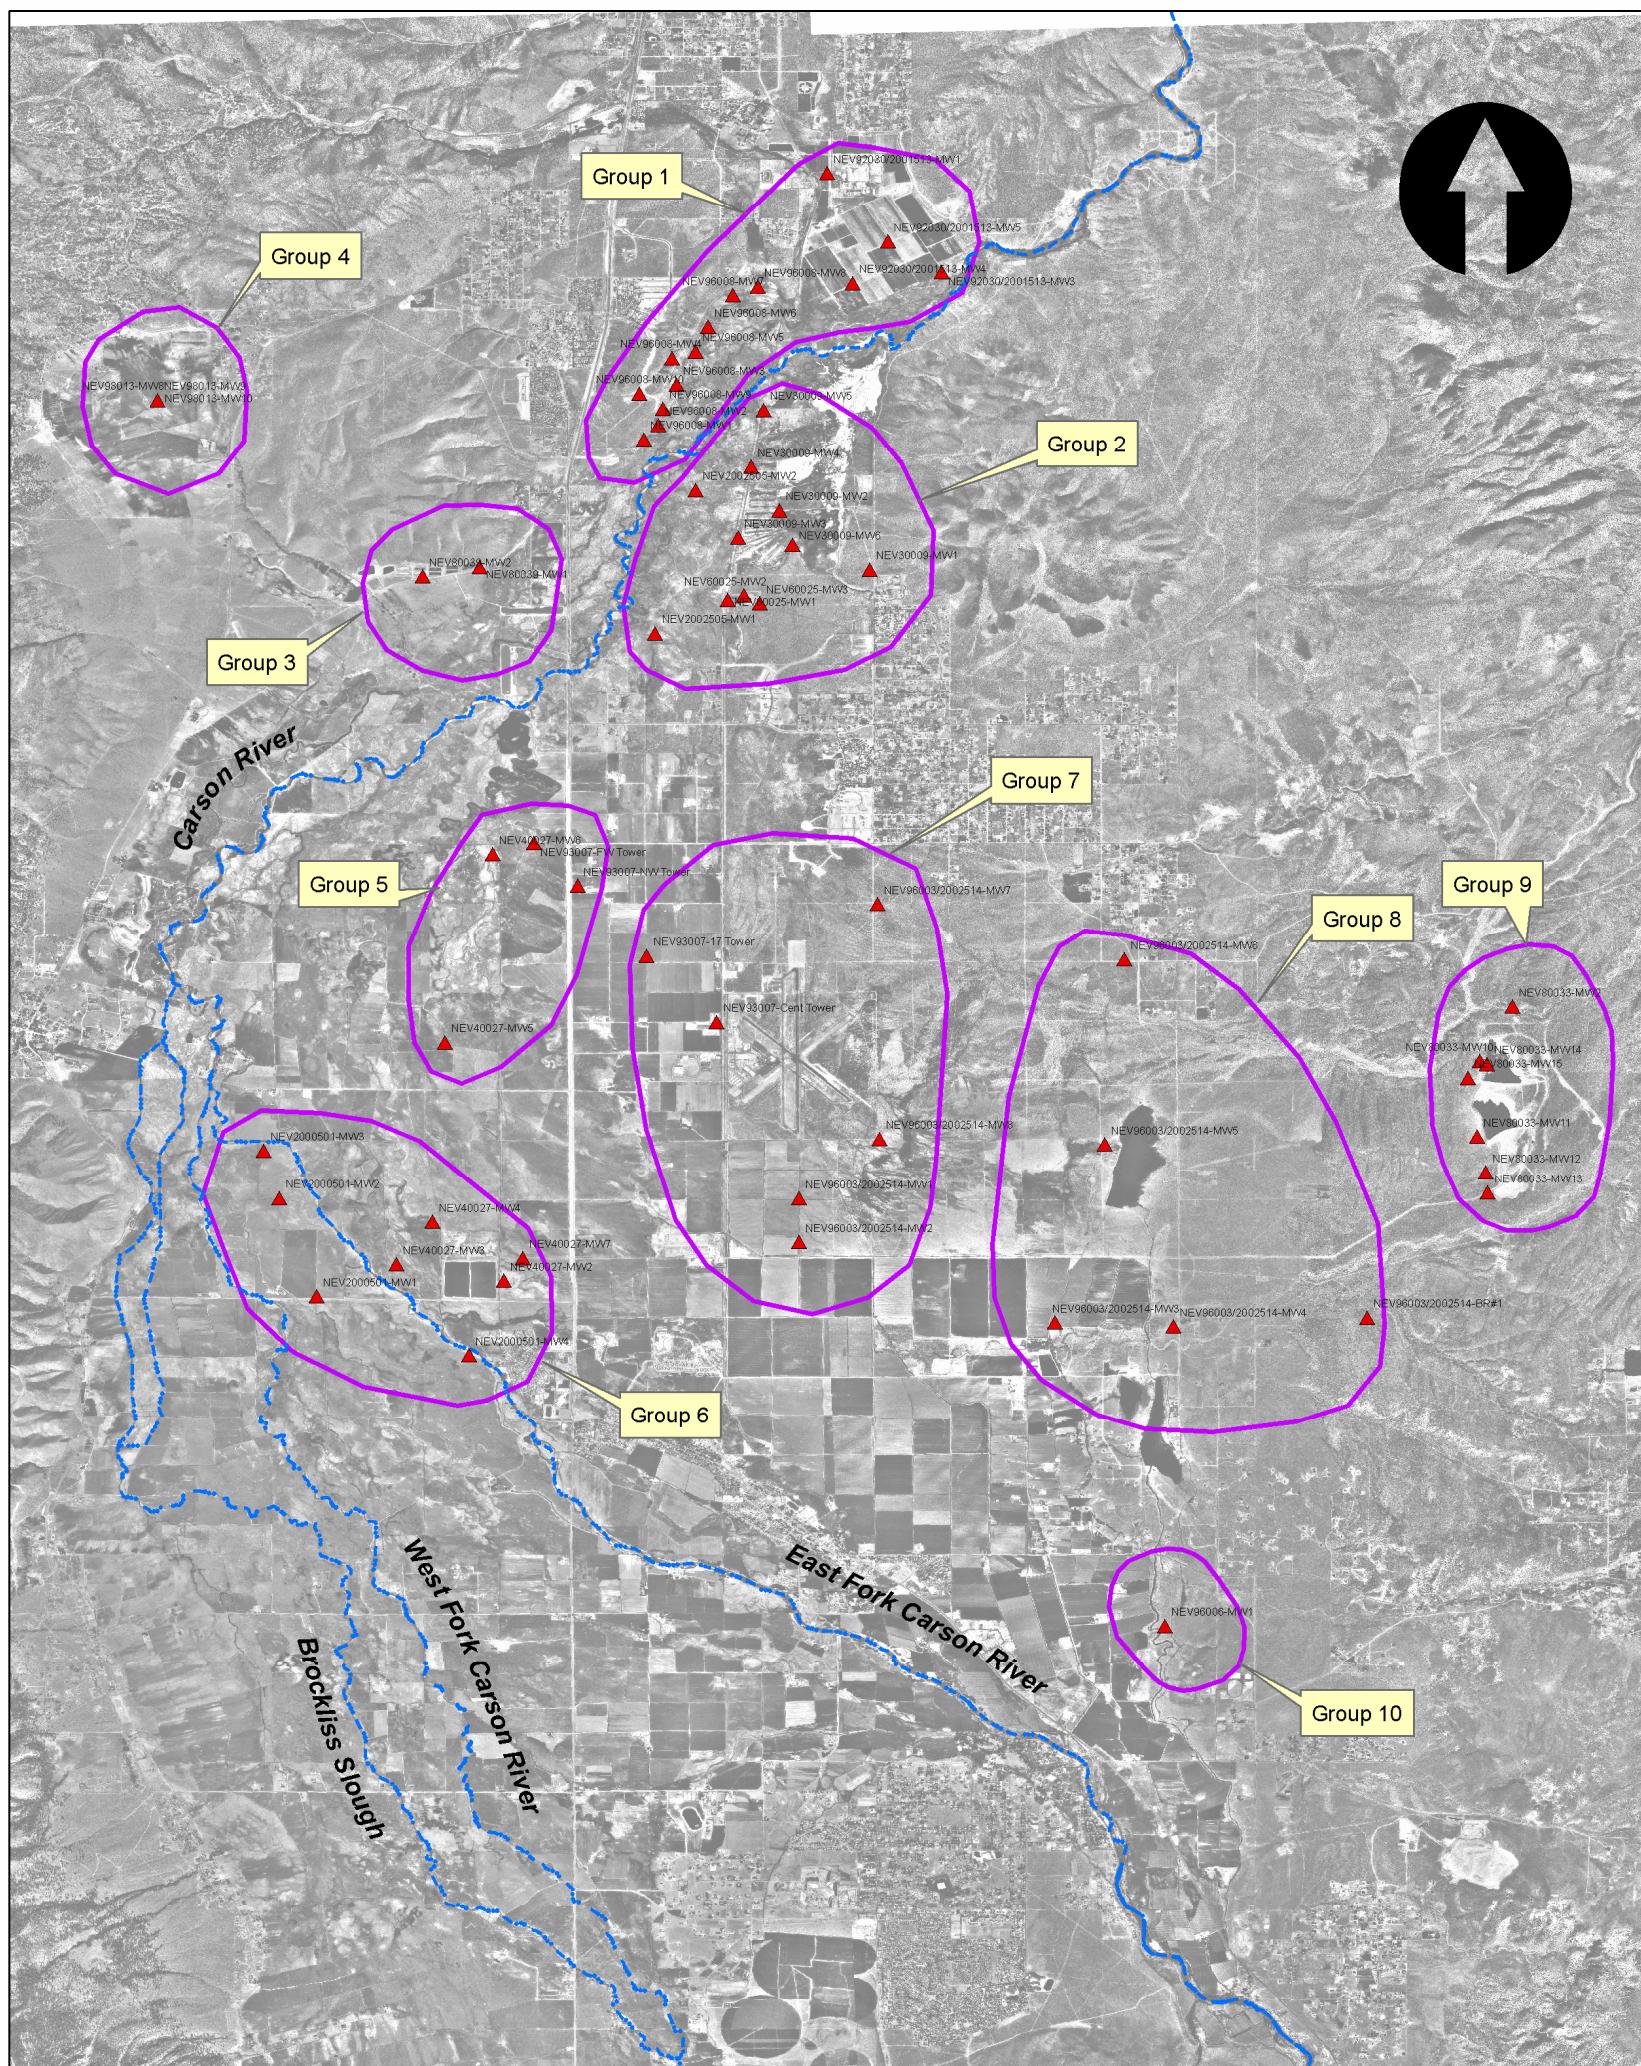

Permit Number	Permittee	Description
NEV30009	Incline Village General Improvement District (IVGID)	Treated effluent conveyed to Wetlands Enhancement Facility. A portion of effluent used for irrigation under NEV98013 (Schneider Ranch) and NEV2002505 (Bently Family Ltd. Partnership - Kirman Tract).
NEV40027	Minden Gardnerville Sanitation District (MGSD)	Treated effluent conveyed to storage facility on Muller Lane, used for irrigation on MGSD irrigation fields and at other locations (NEV2002513 – Galeppi Land and Cattle Company; NEV2002514 – Bently Family Ltd. Partnership)
NEV60025	Douglas County - North Valley Wastewater Treatment Plant (NVWWTP)	Treated effluent discharged to NVWWTP reuse irrigation field and to IVGID Wetlands (NEV30009)
NEV80033	Douglas County Sewer Improvement District (DCSID) No. 1	Effluent stored in Buckeye Reservoir and used for irrigation under NEV2000501 (Park Cattle), NEV96003 (Bently Agrowdynamics)
NEV80039	Indian Hills General Improvement District (IHGID)	Treated effluent used for onsite irrigation and for landscape irrigation under NEV96008 (Sunridge Corporation)
NEV92030	Nevada Department of Corrections	Treated effluent from the Carson City Wastewater Reclamation Plant is used for irrigation
NEV93007	Bently Pressurized Bearing Company	As part of a groundwater remediation program, groundwater is pumped with a series of extraction wells and sent through 4 different air-stripping towers to remove volatile organic compounds (VOCs). Treated groundwater is discharged to Heybourne Irrigation Ditch.
NEV96003	Bently Agrowdynamics	Treated effluent from DCSID No. 1 (NEV80033) is used for irrigation – Middle Ranch
NEV96006	Williams Ridge Technology Park	Treated effluent is discharged to the groundwater through a leach field
NEV96008	Sunridge Corporation	Treated effluent from IHGID (NEV80039) is used for golf course irrigation
NEV98013	Schneider Ranch	Treated effluent from IVGID (NEV30009) used for irrigation
NEV2000501	Park Cattle Company	Treated effluent from DCSID No. 1 (NEV80033) used for irrigation
NEV2001513	Nevada Department of Corrections	Application of horse and cow manure as a nutrient source and soil amendment
NEV2002505	Bently Family Limited Partnership - Kirman Tract	Treated effluent from IVGID (NEV30009) used for irrigation – Kirman Tract
NEV2002513	Galeppi Land and Cattle Company	Treated effluent from MGSD (NEV40027) used for irrigation
NEV2002514	Bently Family Limited Partnership	Treated effluent from MGSD (NEV40027) used for irrigation – Middle Ranch

Group 10	Nitrate as N	3	<0.05	<0.05	<0.05
	Total Nitrogen as N	3	<0.30	<0.40	0.8000

³ Indian Hills GID had high nitrogen levels during 2004. Indian Hills GID is relining its 2 sludge storage ponds in 2006 and 2007 to address concerns with seepage (Maez, 2006).

⁴ Seepage from Buckeye Reservoir led to elevated nitrogen levels in area groundwater. Douglas County SID will be denitrifying its wastewater to meet a standard of 10 mg/l by 2010. In the interim, the flows going to the reservoir will be reduced by 50% starting in 2007. If increasing nitrogen trends are detecting in the monitoring wells during the interim, the facility must have denitrification in place by 2009 (Maez, 2006).
